Source record: 243585

I have found that for a handheld scanner, Radio Slack's entendible whip with the BNC connector works fairly well. I also attached a BNC to my shortwave longwire (about 65', runs the length of my attic) and it also tended to pull them in real good.

Mike

4. Re: Scanning digital cell phones?

Newsgroup: rec.radio.scanner
Date: 1996-01-01 00:00:00 UTC
From: Brian varine <varine@ece.orst.edu>
Message-ID: <Pine.HPP.3.91.960101183755.2537C-100000@holmes.ece.orst.edu>
Source record: 243586

The only way I can think of to scan digital cell phones is to use an
actual digital cell phone and hack it.

As for Digital itself it is not doing well at all here in Oregon. Sound
quality sucks (at best), it drops in the middle of calls, etc. On the
plus side, if you do want a digital cell phone and shop around you can
get really good deals. Cell One offered free ROAMing from the Canadian
Border to the Mexican Border on the I-5 corridor. That included all of San
Diego, LA, Stockton/Sacramento, Medford, Eugene, Portland, and Seattle.
Supposedly it comes nack every few months.

5. Need Schematic for Ultra 308

Newsgroup: rec.radio.scanner
Date: 1996-01-01 00:00:00 UTC
From: cpl@kaiwan009.kaiwan.com
Message-ID: <4ca3bc$r3r@kaiwan009.kaiwan.com>
Source record: 243587

I have purchased an old crystal controlled scanner manufactured in the early seventies by Ultralec in Knoxville, Tenn. It is called the Ultra 308. It is a tri-band 8 channel scanner. It is a mobile arrangement with pushbuttons for power, priority, scan, and pulse controls and, characteristic of scanners from this era, has 8 LEDs across the face which light in succession as the radio scans the installed frequencies. A pushbutton below each LED controls whether a channel is scanned or skipped. An interesting feature is that there is a slide switch on the back panel that enables/disables the delay function.

If you have a schematic or user's manual for this OR know a company that might still handle their literature please email me directly.

I also purchased a Midland 13-925 Dual-Band VHF/FM Monitor (scanner). Also crystal controlled and manufactured in 1972. Likewise, if you have info on this radio, or know Midland's address and/or phone number please email directly.

Thanks,
Perry Locke

6. Re: Spread Spectrum--how works?

Newsgroup: rec.radio.scanner
Date: 1996-01-01 00:00:00 UTC
From: Brian varine <varine@ece.orst.edu>
Message-ID: <Pine.HPP.3.91.960101192045.2872A-100000@holmes.ece.orst.edu>
Source record: 243588

Spread Spectrum (Freq Hopping) works by rapidly hopping the frequency of the phone within the assigned spectrum (902-928MHz). On average it hops approxamately every 300mSec. Your voice is digitized and sent out over digital packets to the base. You could probably detect it using a very wide band receiver over the band. It's a pretty complex operation because of the timing required of the base and hand unit. The advantage over the original method of SS is that it can overcome a lot more interference and penetrate many more obstacles (glass, walls, etc.) There are other advantages as well but thats the basic stuff. Before any one flames me and says that Freq Hopping isn't spread spectrum, it is. When I think of spread spectrum I also think of the method in which many low power signals are transmitted at a level that is below the noise floor but when combined forms one detectable sig. But, FH is now classified as SS so you'll see it as SS(FH) and Direct Sequence is SS(DS).

>When I scan the local police channels, my scanner will stop on a channel
>that is broadcasting continuous noise. I will then have to lock out that
>channel in order to continue scanning.
>
>The next time that I scan the police band, it will be a different channel
>that I have to lock out for the same reason. Are the police attempting to
>prevent the public from scanning their frequencies?
>
Your police department are obviously using a trunked radio system,
regardless of frequency, as trunking is now available on vhf and uhf in
addition to 800 mhz;
the noise you hear is the system control-channel, sort of a transmission
that manages the rest of the frequencies on the system. Where I am that
control-channel is alternated once in 24 hours, so you're going to have to
re-program the lockout on your scanner daily; control channels are not
exclusive to police systems, I have a commercial 800meg trunked Motorola
system thru my work, and it also maintains a daily-alternating control
channel on each of the various repeaters.

__and see what happens.

Cheek, whats imbecilic is you trying to engage someone (anyone) in linguistic fisticuffs. You have gone on at withering length about the nature of the 'virtual world' etc......it seems that a natural philosopher such as yourself would realise the utter futility of engaging in this type of crap. Would you explain how you can ever 'win'? And what if you do get someone to stop posting things that bother you? Will you raise your arms in a victory pose and declare yourself superior? What if it doesnt stop? Will you keep doing it until either everyone in the group is posting about nothing but Bill Cheek or else gives up on the group entirely? I'm embarassed by this, frankly. I think everyone is. What a shame. And this from a once respected professional.

>

I hope you don't prosecute me for the above quote ;-).

I must've missed the Moss diatribes along the way. I scan about 25 newsgroups (only 4 for SW and scanners) and glean data such as frequencies, etc., from them. Keeping up with so many newsgroups makes it impossible to follow the flame wars. I don't really care about the flame wars, yet I understand why they occur.

I only wanted to add my 2-cents here: I have modified RS Pro-34 and 2006 scanners using Bill's instructions from the internet and in Monitoring Times magazine. These mods have enhanced my enjoyment of the hobby and improved the performance of my machines. He obviously knows a lot more than I do and his instructions worked perfectly.

I owe Bill a thank you for helping me do this.

From Barry's email address, it appears he's from Australia.
Perhaps cordless phones operate on a different band there.

Craig

30. FCC License Data Sources

Newsgroup: rec.radio.scanner

http://www.rdrop.com/users/billmc

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists.
The FCC master contains a wealth of data about every non-government license
in the United States (over three million records). Most of the sources
listed contain a subset of this data, although a few contain all or nearly
all of it. Government licenses are not administered by the FCC, and the
data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider
forming a co-op of people in your area to share the cost. As far as I can
tell, this is legal since the information is in the public domain.
However, the software supplied to view or manipulate the data is usually
copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major
cities cost extra.) A 70-mile search costs $178. The data is provided on
floppy disks and is available in ASCII columnar and comma-delimited
formats.

CET does not provide data for licenses that do not contain specific
geographic coordinates (i.e., mobile-only systems) or specific operating
frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of
the 30-mile radius. I calculated mine from a USGS topographic map I
obtained at a local nautical supply store. Alternatively, you can obtain
the coordinates for your town from the University of Michigan's geographic
name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For
my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular | version is $104, and the mapping version is $174.

| Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/ (WWW).

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. The US Index CD also covers the entire US but comes with a more powerful database manager. Regional CDs cover subsets of the US but provide more detail about each license. Finally, the mother of all databases is the seven-CD Frequency Set, with data organized by frequency.

Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465 for the complete five-disc set), and the Frequency Set is $1515. Data is updated quarterly (the latest data is from Nov 94). PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), Pergrim@aol.com (email), or http://www.bluemarble.net/~percon/ (WWW).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately every six months (last update was Dec 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity | discounts available. Fully working shareware copy (FCC215.ZIP) downloadable from their BBS at 360-871-4228 (below 9600) or 360-871-4591 (9600-28.8k). ScanWare Associates can be reached at 360-698-1383 (voice), | 360-698-8207 (fax), scanware@sincom.com (e-mail), and | http://cutter.sincom.com/~scanware/index.html (WWW).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

: Darwin Teague (darwin@iquest.net) wrote:
: -major snip-

: : While you folks are blaming the scanner owners, try to remember that on
: : many airlines now, THEY ALLOW PEOPLE TO LISTEN TO SCANNERS. IT'S IN
: : THEIR FLIGHT MAGAZINE!

: : If THEY don't have a problem with it, why do YOU?

: Which airline(s) was that? Which is, after all, the original
: question of this thread. Again, I was only relating what they said on
: United and TWA. I didn't see anything in any flight magazines to the
: contrary (but I'll admit I wasn't looking).

USAir allows 'em and I've heard from others that have said the same for
other airlines.

BTW, I called and asked (at least twice) and was told "Nope, no can do".
But the magazine and flight officials said it was OK, so it seems that
many employees hadn't heard of the change in policy.

Mike Royko recently wrote an article about how terrified he was of
flying. He wrote the article on a plane with his laptop!!

My, my look at what I found in my /RADIO directory:

Scanning Aboard Airliners

The question of the use of scanning receivers aboard commercial
airlines arises from time to time. The following is an extract from
the FAA Regulations (FARs) and the stated positions of a number of
major carriers.
It should be noted that in FAR 91.21, the term "operator" refers
to the airline, not the pilot. The captain on your flight may impose
additional restrictions depending on conditions, but he may not waive
limits established by the airline.
The quotations from various airline policies were correct as of
the date noted, but are subject to change. If any question arises, ask
the cabin attendant to check with the flight crew, then obey their

instructions. I may be on the same flight, and I would prefer that stray R.F. not vector us into the side of a mountain.

Federal Aviation Administration Regulations
14 CFR 91.21 - Portable Electronic Devices

(a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.

(b) Paragraph (a) of this section does not apply to -
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the aircraft has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.

(c) In the case of an aircraft operated by a holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

Delta Air Lines
from the "On Board" section of SKY magazine, January 1995

PORTABLE ELECTRONIC DEVICES - Current regulations prohibit the use of certain types of portable electronic devices (PEDs) on board commercial aircraft, due to the potential for interference with navigation and communications equipment.
The following devices may not be operated at any time on Delta aircraft: cellular telephones, commercial two-way transmitters (i.e. walkie-talkies); amateur transmitters (i.e. ham radios); citizen band (CB) transmitters; 49 MHz transmitters; devices designed to radiate RF energy on a specific frequency; peripheral devices for computers or games connected by cable (i.e. printers); AM/FM radios and portable TV sets; remote-control toys.
The following may not be operated when the aircraft is at the gate, in the taxi, take-off, initial climb, approach, and landing phases: personal computers (cable-connected peripheral devices such as printers, external disc drives, etc, are not authorized); personal

computer games; VHF scanner receivers; compact-disc players; digital/
cassette-tape player-recorders; video recorders/playback systems;
calculators.
The following may be operated at all times: hearing aids; heart
pacemakers and other implanted medical devices; electronic watches;
electronic nerve stimulators; properly certified operator-installed
and -maintained equipment, such as the public passenger-telephone
equipment. Personal life-support systems may be operated during all
phases of flight, provided that the equipment conforms to the criteria
established by the administrator of the Federal Aviation
Administration (FAA).

United Airlines
press release

UNITED AIRLINES PROHIBITS USE OF
PORTABLE ELECTRONIC DEVICES DURING TAKEOFFS AND LANDINGS

Chicago, June 22, 1993 -- United Airlines today announced that
effective July 1, it will prohibit the use of portable electronic
devices, such as laptop computers and compact disc players, onboard
its aircraft during takeoffs and landings.
United said its policy was developed to address the possibility
of such devices causing electromagnetic interference with cockpit
navigation or communications systems when aircraft are on the ground
or flying below 10,000 feet -- the most critical phase of aircraft
operation.
"We have not experienced any safety problems with these devices,
but enough questions have been raised in the industry to prompt us to
implement this policy as a precautionary measure until further study
determines if any safety hazard exists," said Ed Soliday, United's
director-corporate safety and security.
Excluded from the new policy are electronic medical devices --
such as hearing aids and pacemakers -- and electronic watches, which
may be used onboard an aircraft at any time.
United said when an aircraft is flying at or above 10,000 feet --
which normally occurs within 10 minutes of takeoff and until 10
minutes before landing -- passengers may use the following devices:
o compact disc players;
o electronic cameras (film or video);
o electric shavers;
o hand-held electronic calculators;
o hand-held electronic games;
o portable audio tape players;
o portable video players (tape playback only);
o portable voice recorders (dictation equipment);
o portable computers with accessory printers and tape
or disk drives.

-UA-

American Airlines
from the "Vantage Point" column of American Way magazine, July 1993

[....]

Products known to cause problems include cellular phones, portable radios and televisions, and remote-control toys, which federal regulators have long barred on commercial aircraft. (The Airfones available on most of our airplanes are specially engineered to eliminate interference with aircraft systems, and they have been thoroughly tested to ensure that result.)
The jury is out on whether other devices - small computers, compact-disc players, hand-held video games among them - have similar effects. Although scientific studies have been inconclusive, there is mounting anecdotal evidence of sporatic and poorly understood problems. When safety is at stake, taking avoidable risk is simply unacceptable. That is why some air carriers outlaw the use of electronic devices during all or part of their flights. American Airlines announced recently that it will no longer permit the use of such devices during takeoff and landing, and while flying at altitudes lower than 10,000 feet, the phases of flight during which cockpit instruments are used most intensively.

[....]

Atlantic Southeast Airlines
from the ASA Flight Attendant Manual, pp 3-49&50, November 2, 1993

3.13. Portable electronic devices

A. Regulations

The FAA prohibits use of electronic devices such as AM/FM radios, cellular telephones, etc. during flight. These receivers have circuits which can radiate signals strong enough to interfere with the aircraft's navigational systems. Non-transmitting portable electronic devices shall not be used during takeoff and landing when the seat belt sign is on, or when directed by a crew member, or during operations below 10,000 feet. However, non-transmitting portable electronic devices may be used at other times. If interference from the portable electronic device is suspected, the captain may prohibit operation of the device.

1. Prohibited equipment
The following may not be operated at any time on ASA aircraft:
a. Cellular telephones.
b. Commercial two-way radios (i.e. Walkie Talkie).
c. Personal two-way radios (i.e. Ham operators).
d. Citizen Band (CB) radio.
e. 49 MHz Transmitters.

f. Peripheral devices for computers or computer games
(i.e. printers, external mouse, "joy sticks").
g. AM/FM radios and televisions.
h. Remote controlled toys.
i. Devices designed to radiate radio frequencies (RF) energy on
specific frequencies.
j. Cassette tape players with AM/FM radio capability.
k. Cpmpact Disc players.

2. Acceptable equipment
The following may be operated when there is not a sterile cockpit in
effect. The devices must be turned off when the seat belt sign is
turned on for approach.
a. Personal computers (see restriction f above).
b. Personal computer games (see restriction f above).
c. VHF scanner receivers.
d. Digital cassette tape player-recorders.
e. Video recorders/internal playback systems.
f. Calculators.

3. The following devices may be operated at all times.
a. Hearing aids.
b. Heart pacemakers or other implanted medical devices.
c. Electronic watches.
d. Electronic nerve stimulators.
e. Electric shavers.
f. ASA installed equipment.
g. Pagers.
h. Acceptable personal life support systems.

Due to popular command I've created a new mailing list, this
list covers all of Eastern Mass from West of Worcester to the
East right to the water.

To subscribe to the list, send a message like this:
To: scan-mass-east-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-east-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

Tell your friends and spread the word! :)

The other lists I'd created are now closed.

Not all the above frequencies are used in all areas. Cities throughout the country have been allocated a few of these channels. Check out http://www.li.net/~j4dice/scanning_info/aviphone.html for a list of city allocations.

>Thanks
I have the Radio Shack discone antenna in the attic of my townhouse and
the thing works great. Most of my listening is 118 to 136 Air band
(I'm a pilot). And I also do alot of 225 to 400 Military Air listening
with it. For local police bands in the 155, and 800 MHz, I can pick up
stuff 50 miles away with no problems.
For VHF-Lo work the antenna does a fine job as well.
All-in-all I'm very pleased with mine.
George

Is there any mods that can be made to the R/S PRO-60.
I have the Pro 60 and like it alot, just wondered if there was anything
else it can do.

NO. The law was changed about 2 or more years ago.

: ps: please include law if it is and if you have it.

Don't have it, but I travel in CT and all the old signs
came down right after the law changed.

I have had the misfortune to have to fix this problem. It is a pain in the ___ and not for the faint of heart nor for someone without a jewelers screwdriver set. It's been a while..

1. As you noted, remove the 2 screws under the batteries.
2. There are 2 screws in each of the rubber grips on each side of the radio. If I remember right remove ONLY the back screw on each side. A little metal plate is used on each side which will naturally fall off if you remove both screws on each side.
3. The 2 halves will separate at this point.
4. I'm a little fuzzy at this point but I I had to remove a few screws

from topmost circuit board AND from the bottom one mounted to the front panel. Then I had to CAREFULLY bend/separate the boards apart on the end away from the antenna so that I could unsolder the ground connection of the antenna away from the circuit board, giving me enough room to open the assembly more.
5. I then used a little pair of needle nose pliers to tighten the nut holding the antenna in place. I had a hard time tightening it to my satisfaction and probably should have used a small hammer and screwdriver to tighten the nut more. I used a touch of glue to help hold everything in place.
6. I then reversed the proceedure and cussed alot because I removed both screws from the rubber grips.

As I said I may have missed a step or two but this is pretty close. I believe the topmost circuit board pulled free from connectors and could be set aside before separating the other two.

This is a great scanner but poorly laid out from a mechanical standpoint. Hopefully I won't have to do that again. By the way I did not remove the knobs since they are glued in place with a light coat of silicon cement to keep them in place. Good luck! If you find an easier way post it.

Greetings and Salutations, ScannerFans:

I read with a great deal of interest the recent "open letters" posted to and about me on alt.radio.scanner and on rec.radio.scanner. There has also been a small flood of e-mail over the last ten days. Accordingly, I shall take this opportunity to speak my piece. So what first, the good stuff or the bad stuff?

Let's start with the bad stuff and work up to end on the good. The bad shit is that a fellow by the name of Andy Moss in Ontario, Canada, has taken it upon himself to rid the world of me and what I try to do for Hobby Radio. He thinks, and has some of you believing that I am utter evil and a personification of a discarnate entity from hell.

Of itself, that's ok. He's entitled to his opinions, same as you are yours.....and me, mine. Unfortunately, he took his personal feelings and catapulted them into some sort of a "Crusade" against me, first on the FidoNet SCANRADIO forum about a year or so ago. Mr. Moss promptly got himself evicted from the forum; his tail feathers severely burned.

Smarting from that little fiasco, Mr. Moss took his Crusade here to the newsgroups and perhaps to other media where he can't be evicted. He continues his little war to this day. But up to this point, no problem. Canada and America are free countries, and the newsgroups are free media. Right?

But Mr. Moss has been considerably less than candid in the conduct of his little war. He has lied, warped, distorted, and misstated the truth on many occasions. He feels the end justifies the means. Lots of tyrannical despots through the course of human history have felt that way. It is nothing new. Neither is the suffering caused by these slimeballs.

Now all that aside, I have been in close touch with many of you over this last year. I have also idly watched the goings-on, the lies, the half-truths, the mistruths, and the downright nasty skullduggery and treachery that Moss has employed in his "work". And I have watched some of you swallow his line of crap: hook, line and sinker. Cool. We're all free, right?

Ummmmmm, me, too. So when I exercised my freedom to poke a little fun back at Mister Moss to see what he was made out of, my goodness, the thunder rolled; the lightning flashed; and voices shrieked out of the woodwork. One sicko moans:

" I'm sure I speak for most if not all the readers of this group when I say that we are _sick_ of your crap here. We are interested in scanning news, not Cheek-speak. "

Another snivels, "Go back to FidoNet where you below...."

Several more offer sage advice, "Cheek, this makes you look bad, and it damages your credibility and reputation...."

A few others said they'd put me on their "Kill List" .....

A couple even said they'd never do business with me.....

Geezus H. Kriste, people, what the hell is this? Nazi Germany? Castro Cuba? Hussein Iraq? Stalinist Russia? Ok, ok, so some of you good folks don't know me all that well. Here are the first and last things you NEED to know about me, if you never know anything else:

FREEDOM OF THE PRESS
FREEDOM OF SPEECH

I am a salwart supporter of these two fundamentals of the American Bill of Rights and the first Amendments to the Constitution of the United States of America. I will fight and have fought for YOUR access to these rights, and I will take them for myself as well. My regard for these fundamentals is unconditional and resolute. This simply means that when I have something to say, I will say it, and neither hell nor high water, nor threats and intimidation, nor sniveling and whining will deter me. THIS is all some people need to know about me. Others might want to know one thing more.

Yes, I can TAKE it. I can be ragged, bullied, roasted, and taken to the cleaners. And when they're done, I will get up, dust myself off, and launch a Size #13EE crosswise up the sweet patooties of those who erred in judgment by first dishing it out. The moral? If they can't take it, they oughtn't dish it out. The compensation? I will never be the first to dish it out.

Now then, let's move up scale a little. To those who threaten me with "damaging my credibility", or losing business, and that sort of thing......I have THIS to say about THAT.

Eat my shorts.

These folks need to know a little something more about me.

First and foremost, I am not present on the newsgroups, nor in any other public medium for the purpose of doing business. Radio is MY hobby, same as it is yours. It so happens that radio is also my business, my vocation, and my livelihood, but I deal with those aspects quite apart from the public forums. My presence in these media is exclusively to render technical support and assistance to those who need it; and to learn something for myself. That's it.

Now there is the old adage against mixing business with pleasure. So I try very hard not to. In a word, I don't give a hang how I "look" nor how "credible" I appear to be. I am not a politician. I am not subject to intimidation, fear, and anxiety over how people perceive me. To those who have tried to intimidate me with threats of this nature, I must sincerely call attention to the bouquet of mistletoe that's attached to my shirttail. In all liklihood, I probably don't want to do business with those who don't want to do business with me. I'm a 2-way man, all the way. If it's one way, I'm probably not up for it.

Upscale some more now. My e-mail box has a number of missives in it, wondering why I was "afraid to come out to the newsgroups to meet Mr. Moss in public". In a word, this was the catalyst that prompted me to commit to participating on these newsgroups. A number of people thought Mr. Moss had me buffaloed. That was erroneous thinking but hey, at least there was an element of logic to it. So I shuffled some priorities and opted to "come out" and do a little dancing of my own. Here I am. No fear. Ready. Waiting. (Come on, Mossy baby, come on, come on.....heh heh heh)

Mister Moss sang, fiddled, and danced this past year, thinking he was in total safety. Well, the good Lord, in the process of Creation, made some men out of flesh and blood and others out of shit. It is sometimes hard to tell the difference. So my first order of the day is to determine what Mister Moss is made of. THEN, I will be all too pleased to get down and dirty into the sciences, arts, and crafts of scanning. Remember....YOU gave Mr. Moss the opportunity to wage his little war. I will now TAKE my opportunity to see what kind of stuff Mr. Moss is made of. (Yes, I know, a preposition is a terrible thing to end a sentence with.....)

TOP SHELF. Many, many folks on these newsgroups have been heart-warming and congenial in welcoming me here. For you, I am pleased to be here. I hope to be able to rearrange my networking priorities to spend substantial time with you. I don't like and am not comfortable with the structure of newsgroup messaging in terms of the poor quality readers and editors thus far available. I am accustomed to and prefer

message readers and editors that keep better track of headers and threads, but I'll manage, and I'm sure better software is in the offing.

THE BOTTOM LINE. I am intimately aware of the nature of network messaging, public and private, and of the mechanics it takes to support the system. I run two private technical wide area networks, a local area network, and a worldwide networked BBS. I use Windows NT 3.51 Server and Windows 95. I know a bit of what I'm doing and of networking in general. Not only am I a subject-matter expert in scanners, but I build and upgrade computers and network systems. I don't know that I am an expert in these areas, but definitely a journeyman.

I also know the ins and the outs and all differences between virtual reality and actual reality. That's one reason why I am not concerned with how I or others "look". I am not concerned with "Kill Lists"; "bandwidth", as some put it; and "abuse" as others put it. That stuff is pure tommyrot.

Virtual reality, such as these message media, are the closest thing yet to what William Shakspeare meant when in one of his works, he wrote, "All the world's a stage, and we are the actors on it.....". This virtual medium IS a stage where everyone is free to give appearances. And no matter what, that's all it will ever be is....APPEARANCES. Good, bad, or indifferent, it's at best...appearances. You cannot possibly hug, kiss, spit, chew, or draw blood in virtual reality.

There is no way under the sun you can be forced to read messages that you don't want to read. There is no way you can have tobacco juice spit on you from your monitor. There is no way you can be deprived of any freedoms or rights in these virtual reality newsgroups. With 16,000+ newsgroups and hundreds of articles in each, "bandwidth" is NOT a consideration here. To get something said, dealt with, and done is far better than slinking around with a festering problem.....like Mister Moss.

Virtual reality offers total freedom to both sides of a communique. It cannot convey any harm or offense, except by creation in the minds of the recipients. In a word, offense cannot be given in this medium; only TAKEN. If taken, then that is a matter of choice....and an exerising of your basic freedoms. Sure, you CAN choose to take offense. It's your right. It is very difficult to GIVE offense in this medium.

Now as far as Mister Moss is concerned, his persistence has made a real thing out of virtuality; real in the sense that many of you don't want me here. Tough. I'm here. But to

show you something of what I mean, please understand that I am going to continue having some fun with Mister Moss until he indicates it's time to quit. He started it.

I get to play, too. Now as a service to those who look down on me for it, you may rest assured that I will structure the subject line of all such messages to or about HIM so that you can determine right off whether or not you want to read them. The most common complaint has been something to the effects of "Cheek speak" and "I don't want to wade through messages that I don't want to read."

Well, one cardinal principle of network messaging is to structure subject lines to reflect something about the content of the message. That's the best I can offer to those who would deny me my opportunity to meet Moss on his own terms. I won't be denied. I won't acquiesce to threats, whines, howls, pressure, intimidation, nor personal advice of the philosophical sort that verges on religion.

I don't "turn the other cheek" as 6,000,000 others did in 1938-1945 and 2,000,000 did in the 1970's. The solution is, however, DON'T dish it out if you can't take it. And get out of the kitchen if you can't stand the heat.

My commitment is to not be the initiator of inflammatory situations. And within limitations, I'll avoid adding to one. But there are lines....if someone attacks me, I reserve the right to counterattack. The solution is DON'T attack in the first place.

On that note, I plan to be active in the scanning scene here on the newsgroups, and I will be active in meeting Mister Moss head on to resolve the issues he has raised and perpetrated over this last year. It is a very simple matter that need cause no one any grief unless they WANT grief.

Thanks to those who have been neutral or positive... your synergy and energy goes a long way. It's appreciated.

AND thus far, no offense taken from those who have been gross and negative. I understand that Mister Moss has a deathgrip on some people who can no longer be positive. If I think you are one of his shills, I'll probably just feel sorry for you. If you don't persist like he has done, I'll probably listen to your opinions and just go on about my business. I won't be altered by negativity, however.

I'm here, probably to stay.

Oh....one more thing. Moss loves to point out what he thinks are my mistakes and errors. Sure, I made a few here and there.

Don't YOU?

Let me suggest that Mister Moss doesn't make mistakes because he doesn't have the balls to get up and write or publish something that will require him to be the subject of scrutiny. He doesn't dare..... and to some extent, because he has skeletons in his closet that go back a long way. Mister Moss can't hold up to a sustained scrutiny.

I can.

My skeletons are those of a youthful sowing of wild oats and subsequent prayer for "crop failure". Same as most of you.

There is nothing in either my public life or private life of which I am ashamed or afraid to deal with in public as necessary. On the other hand, I am not running for public office, and my private affairs are not really yours to test UNLESS yours are also subject to test. Like Moss's, for example. He's tested mine. I shall be testing his. Mister Moss has some VERY INTERESTING private affairs, you see.

The alternatives? The alternatives are simple. DON'T dish it out unless you can take it. And when someone else dishes it out, don't sit there idly minding your own business and then hose the poor bastard who TOOK it in the first place. STOP the one who dishes it out or else keep your peace when there is a response.

There it is.....the good, the bad, the ugly. Like it or lump it. Do with it as you please. My position is resolute.

Meanwhile, I await Mister Moss...with great anticipation... licking my chops. If he doesn't appear, then I await scanning with even greater anticipation, drooling in fact.

Sure, widely published, too. It may exist in text file format around various archives, but be careful there, since text files cannot offer pictures, schematics and the kinds of details required in a critical mod like Extended Memory.

In a word, the stock SRAM chip (2k x 8) is replaced with a larger SRAM (32k x 8) or (256k x 8) to yield 6400 or 25,600 channels. External addressing is required to organize the Extended Memory into "Blocks" of 400-channels each. 6400 channels comes out as 16 Blocks of 400-ch each, while 25,600 channels comes out as 64 Blocks of 400-ch ea.

The mod is not terribly complicated and has been done by laymen all over. I published it in all three of my books and in back issues of the monthly WORLD SCANNER REPORT. I will also offer tech support on it via the newsgroup should you wish to try it and run into trouble.

There ya go for starters.

Happy New Year!

Hey Bill, I'm looking to purchase the 256kX8 SRAM (If I can find one) but like
you mentioned above, the text files that are abundant out there don't have
schematics of what gets put where.

If I may ask you (and I know this is in your book), how are the 4 10K 1/8 w
resistors and the dip switchs actually hooked up? The text file mentioned the
resistors as pullups but not being of a digital electronics mindframe I can't
figure that one out.

BTW.... Loved that letter stating your position on this whole mess, I agree
with you, if a person doesn't like the postings that you and Moss are into at
the moment, all they have to do is delete them. Easy enough, I do it all the
time on those threads that don't have my intrest.

As far as I'm concerned, you're MORE than welcome to post whatever's needed.

If you have a radar detector and have ever been to a Safeway store that has automatic doors then you have most likely had your radar detector go crazy. Lets call this a proxmitity detector. It detects an object in its proximity and responds (by opening a door). If one was to mount one of these on the dashboard to inform you that you were following too close to the car in front of you and beeped.... Just think what the signal would do to the receiving end of a police radar unit. I had a judge throw out a ticket because the officer could not tell if the digits on the display represented the speed of my car or the signal from the nearby Safeway store...

: In the book it states that some of the information is designed as decoy
: info to prevent copywright infringment. This could possibly be it.

: jburton@pacifier.com

No. The information that is designed as a decoy is added information, not modified entries. If you know anything at all about radio, then you know how fast everything changes. The most up to date FCC database on CD is old before it even makes it to your mail box. With the shutdown everything is moving slower. When in full operation the FCC will issue and process about 2000 license a day.

If you want 100% up to date information, you can subscribe to a online service that uses the live FCC databases. These are updated as the license is issued. The service runs about $24.95 per lookup. These are good for everything but military radio.

I would agree however that attempting to add false data is sort of silly. Attempting to copyright public information is silly too. Gene and I have talked about this in the past. He shrugs his sholders. I don't see a change in this, so it's best ignored.

So, what would you like to see done? I attend the West L.A. RCMA meetings. Gene attends these as well. So how dose someone fix your problem? Keep in mind that the book goes to publish, and before the ink is dry, license data has changed.

This does sound like a typical trunking control channel;
However I have listened to a VHF conventional Police radio system here in Ontario for a local police dept.
where they broadcast an annoying computer data tone when the repeater is not in use. The purpose is to prevent scanner listeners since A) the continuous transmission prevents the radio from scanning and B) the data noise is VERY annoying! What they do is drop the PL (Private Line) sub-audible tone when the data noise is being transmitted...
that way, their own radios never hear the noise. A Ham radio with a PL decoder or a newer bearcat scanner with PL can defeat this system. The Ontario Provincial Police also have
a similar system on VHF whereby "data" is transmitted
on "marker" frequencies when there is no voice transmissions. Unlike the other system I described, this
data is actually used for control by the mobiles (not unlike a control channel in an 800 Mhz trunking system). Again,
PL is used to eliminate the data from being heard over the radio's speaker so a PL capable scanner or
ham radio will elimiante the problem.

I see. Then you need to go for the gusto and make it count. Talk about "threats"......whooooey, I never did anything to you and you're all huffed and puffed, blowing and going like that boom box dude to which you alluded. You are one very strange fellow, Alexander, and quite possibly on the edge of making Mr. Moss look like a saint. At least I think he thinks I did something to him. You just fancy yourself as the newsgroup "wheel". (Pssst, you're dripping!)

Ummmm, you don't by any chance happen to have a harelip or a gap between your teeth, do you? Perhaps a severe overbite? High, jutting forehead? Knuckles bleeding from dragging the ground? I can refer you to some professional help if you would like.

And you write books, too?

> Coming soon to a bookstore near you,
> The Underground Guide to Computer Security, by Michael Alexander;
> published by Addison-Wesley Publishing Co.

My goodness. Oh my..... Good gracious..... Shoooooey. Really?

Low Power FM Transmitter to Relay Scanner Audio
to a Car Radio or Stereo Receiver.

I came across a design from 1969 which uses a simple 2-transistor
circuit to generate an FM carrier in the broadcast band. The carrier
can be modulated with the output from a scanner (or any other audio
source) to relay the signal to a car radio or a stereo receiver.

I modified the design a little by including an isolation transformer
at the input. The transformer came from my junk drawer; it is a Radio
Shack miniature 8 ohm to 1K ohm matching transformer. The old pnp
transistors may be hard to find, but the types are not critical. The
oscillator transistor should be capable of operating at 100MHz.

Layout is also not critical, but you should keep all connections as
short and direct as possible.

My unit is tuned to 89.9 MHz which is a quiet spot on the dial. The
range is quite low and is really only reliable over distances of a few
feet. No antenna is necessary.

I built the unit to listen to my portable scanner over my car stereo
system while travelling. It works remarkably well. The circuit diagram
is attached to this post as "micro-fm.gif". Enjoy.

>manufacturers make digital scanners?

Motorola doesn't claim it's scanner proof, they emphisize the fact
that conversations can't be followed easly. I have found that about
half the channels are not even used. I have them locked out, but go
back to them every now and then to see if they are being used. Try it
listen for 30 mins and mark down each hit. The pattern says all. I
have a hard time believing that you have personally spoken with half
of the PPB force. They know about the inability to follow
conversations.

As for the above statement that scanner folks aren't that important.
I have a suggetion. Try following the police around for a while. Go
to every major event and a few minor ones. Make yourself more
visable, and you will find out just how concerned the police are about
scanner folks. Personal experience is that you WILL be investigated,
whether you are suspected of a crime or not! I know for a fact that
myself and others were investigated for our political views ONLY!!!
Acording to Oregon law that is a crime! Try obtaining some specific
police reports and see what happens when you ask.

Officers are putting NOAA on the trunk to slow scanner folks down.
This is confirmed!!! No reason as to why was given even when pressed.

I believe you can get a trunked (receive only) radio from the PPB on
lease. I haven't checked on this yet but have heard that it is fairly
expensive. Also, it only has 3 channels of the system on it.

>Mike Osenga

They suck! I have one too, and am not very impressed at all! I get a
lot of air traffic on my VHF high channels, the antenna connections is
lousy, and it's reception abilities pale in comparison to most of my
other scanners that are in that price range.

Tired of the non-stop banter of the EGO we all know as Bill Cheek? Try fowarding every NON-TECHNICAL self-righteous post that he makes to:

postmaster@cts.com

While they specifically deny responsibility for what passes through their server, enough fowarded messages may help fix the problem. I've tried sending his posts back to him, but it doesn't work. You can try if you like, but I think the postmaster is a better target.

To Bill:

If you have something CONSTRUCTIVE to say, go ahead. Tripe? You can keep it.

These are for a Statewide Astro digital system used by state government agencies such as the FL Highway Patrol, Marine Patrol and Division of Law Enforcement. Since this is a digital-only system you would only hear the buzz of data on your scanner if the frequencies are in use in your area. I don't believe that the North Florida part of the system is constructed yet, but the system is very active in South Florida.

I have a Bearcat 100 which will no longer charge the batteries. (Yes, I even tried putting a new set in.) The unit will only work if the charging unit is plugged in. Any ideas on what the problem is? I live in the San Jose area, where can I take it to get it repaired for less the value of the radio itself? Please E mail me.

93. OS535 Cellular Unlock Program

Newsgroup: rec.radio.scanner
Date: 1996-01-02 00:00:00 UTC
From: eevans@aol.com
Message-ID: <4calaq$eov@newsbf02.news.aol.com>
Source record: 243566

After much work, I have found out what the unlock code is for the OS535/Pro2035 combination. I have written a shareware program whose sole purpose is to unlock the OS535. This would allow the user to then use his scanning program of choice after running this program. I would appreciate it if a person or persons would allow me to post it on one of the modification internet sites.

Thanks,
Eric

Happy scanning

94. CI-V

KR>Message-ID: <4c38m9$ptk@newsbf02.news.aol.com>
KR>Organization: America Online, Inc. (1-800-827-6364)

KR>Transmit Data and Receive Data are tied together at the 5 volts level side
KR>and connected to the ICOM CI-V You will need to get a copy of the
KR>protocol. I got mine from ICOM (FREE), and I didn't have to buy the
KR>interface. I couldn't use it anyway.

Is the protocol simple enough to post?

KR>MAXIM has a number of 5 Volt only chips that are multi Channel
KR>Receiver/Drivers.They are numbered from MAX-220 to MAX-249. This is what
KR>ICOM uses in their device The ICOM Interface allows for the use of more
KR>than one radio on a kind of "Serial Bus"(if you will.) The protocol
KR>handles Data Crash detection and has a specific address for each radio
KR>made R-7000 etc. I have just ONE radio and suspect that MOST PEOPLE
KR>have only one radio. (don't forget R-7000's are $1500 used.)

EIA-232 is not a multipoint standard. That is, you can not just wire-or
signal lines to connect transceivers. How does CI-V handle multiple
radios. [BTW, I work at Maxim. There are quite a few 232 chips that
follow the MAX3xxx numbering scheme, where the "3" indicates 3 volt
operation. Some have a wide enough range where you could power the chip
from a internal scanner voltage, such as the 4V in the AR8000.]

KR>What the interface DOES NOT HAVE is a way to detect squelch break. I used
KR>the RS-232 "BELL" line and the RECORDER REMOTE reed relay output. The reed
KR>relay is fast enough.

I have never hooked up a tape recorder using a remote. Does the first
part of the recording get cut off or have a frequency shift as the
recorder starts up?

KR> I have found that I am mostly interested in Military Air VHF/UHF
KR>(118-149) Mhz / (225-400) Mhz and also INMARSAT comms around 1535 Mhz
KR>using a 4.5 foot parabolic.

Most mice steal power the same way. Make sure you have some sort of
clamp on the line or voltage dropping scheme as the legal limit of a 232
transmitter is +/- 15V.

Aw, I ain't sitrring the pot, exactly. Moss just slung shitballs at me for the last year from the safety of the newsgroups after getting his ass booted off the FidoNet. So I come over here to ramdrive a cannister of his missed shots down his throat, and there's a few high and mighty, sanctimonious types rising to demonstrate their prowess by threatening me with loss of business, loss of credibility, loss of reputation, and loss of their good will if I don't shaddup and get outa here.

Wellllllll now......I don't take a shine to them sorts of shennanigans......and I don't obey ignorant, sanctimonious orders all that well. So there's a small handful of upset folks. Which is the screaming shits, as I see it, because I don't recall ever signing on the dotted line promising to live up to their expectations. They seem to think I did......so we're in the "negotiating" phase right now. That's all there is to it, really. Just some dickering and wheedling is all..........

<grin>

>resistors as pullups but not being of a digital electronics mindframe I can't
>figure that one out.

First of all, use 100-k resistors in place of whatever is shown in the
books. There have been a couple revisions and I'm not sure which you
have. Next....these resistors are used to allow the address pins to
be switchable between high or low (5v or ground) without blowing
anything up. Here is an ASCII drawing of one resistor
connection......

```
+5v o----------/\/\/\/\--------+----------Address Pin
100-k |
/ Switch
|
Ground
```

Thus, the address pin is switchable between ground and +5v. The 100-k
resistor is insignificant to the multi-megohms input impedance of the
address pin, and when grounded, allows a minimum current drain from
the source.

>BTW.... Loved that letter stating your position on this whole mess, I agree
>with you, if a person doesn't like the postings that you and Moss are into at

>them. Keeping up with so many newsgroups makes it impossible to follow the
>flame wars. I don't really care about the flame wars, yet I understand why
>they occur.

Sure they occur....for a couple of reasons. (1) Someone gets a wild
hair and takes a pot shot at someone else who is in no mood to put up
with their bullshit, and (2) Uninvolved messiahs, preachers, and
sanctimonious holier-than-thou's who already have their lives so well
ordered that they can afford to criticize others.

>I only wanted to add my 2-cents here: I have modified RS Pro-34 and 2006

>instructions worked perfectly.

>I owe Bill a thank you for helping me do this.

I am pleased to be at this sort of service. It's one of the things
that makes the hobby go round and round. I'm glad to be able to play
a role. So do many others. So what the hell....who cares if there is
a big ol' snit once in a while? I don't. They happen in real life,
so they might as well happen in virtual reality, I reckon.

Regards & Happy new year! And LAUGH at the bad vibes so they won't be
so bad. A peeing contest can be funny and enjoyable. And one thing
is for sure....we'll do less damage than out on that football field
during the SuperBowl where life, limb and fortunes hang in the
balance.

Ok. Two things then:

1. Eat my shorts
2. Stick it where the sun NEVER shines

> But as long as you and Moss keep yammering about your private
> business in a public forum, I and I'm sure others will too, will tell you
> where to stick it.

Like I did you? Looks like you are on an upward spiral of some good
old fashioned yammering your own self. And no one jumped your shit or
pulled your strings. Like a very stupid carp, you just leaped out of
the water; into the boat; and flopped around in search of a bare hook
to sink your teeth into. Careful, now. You get that hook too deep
into your gullet and it's going to be awful hard to spit out.

Geez, man, with suckers like you around, I don't need Moss. He's
expensive. You're free. By the way, are you some sort of a messiah
or preacher-man? In the service of some deity, or higher power?

You seem......well.......sort of .....inspired. You remind me a lot
of ol' whats-his-name.....that maggot, Rev. Jim Bakker. You look
like you could even conjure up yourself some of them big ol' horseturd
tears to make it look realistic, while you beg for donations and
support for your Great and Righteous Cause..

>Geez, talk about wasting bandwidth!

And YOU are the epitome of bandwidth conservation, right?

<giggle> <snicker> <chortle> <gasp.....wheeze....gag>

>Michael Alexander

That wouldn't happen to be SAINT Michael, would it?

Can't. Winning is NOT what it's all about. But you wouldn't
understand if I told you....so let me save my breath.....

> And what if you do get someone to stop posting things that bother you?

Heaven forbid.........

> Will you raise your arms in a victory pose and declare yourself superior?

Noooo, I'd probably cry a little.......

> What if it doesnt stop?

I don't know. We'll cross that bridge when we come to it.

> Will you keep doing it until either everyone in the group is posting
>about nothing but Bill Cheek or else gives up on the group entirely?

Don't you think for a minute that everyone, you included, makes
CHOICES? I make mine. Clearly....you make yours. So do others.

> I'm embarassed by this, frankly. I think everyone is. What a shame. And this
>from a once respected professional.

So don't respect me then. From the sound of you now and in past
messages, it is very remote that I'd be interested in your brand of
respect anyway. So don't worry about it and I won't. Deal?

You can stop posting to and about me. I can stop posting to and about
you. That way, there will be two less stupid messages per posting
cycle, and thereby you and I will be doing the group a favor. Deal?

[NASWA letterhead]

NASWA

North American Short Wave Association 45 Wildflower Road
Levittown, Pa. 19057
NASWA1@aol.com

NASWA Announces its new WWW Site on the Internet

Levittown, Pennsylvania, USA--January 2, 1996--North America's oldest shortwave broadcast-only club is proud to announce that starting today, it is moving into the 21st century with the opening of NASWeb, its home page on the World Wide Web. The web page, months in development, is expected to provide members and non-members alike with access to timely information about developments in the shortwave hobby. The page is available at http://www.mcs.com/~ralph/html/naswa/.

Richard A. D'Angelo, the club's Executive Director, notes that, "NASWA has been active in the exchange of information among dedicated hobbyists since 1963, and is happy to take advantage of this new medium of communication to provide the kind of service to our members that our devoted volunteer staff has provided through The Journal and, before that, FRENDX, for so many years."

Ralph Brandi, NASWA Web Master, expects that the site will provide hobbyists with the best of both worlds. "The Internet excels in delivering information to a wide range of users very quickly. Hobby clubs like NASWA have always prided themselves on combining speed of delivery with quality of information. We see the development of NASWeb as a way to keep the traditional hobby club edge in speed of delivery even as we improve that timeliness, while bringing to the Internet the quality of information we've always been known for."

NASWeb strives to provides samples of columns from each month's copy of the club's monthly bulletin, The Journal, slightly ahead of the arrival of The Journal in club members' mailboxes. Typically, three or four columns will be made available, covering the wide range of topics made available in the print edition of The Journal each month, for

example,program listening (Easy Listening), station loggings, (Tropical Band Loggings and International Band Loggings), club news (NASWA Notes), equipment reviews, and the best DX tips from around the world (Listener's Notebook). Over the course of a year, samples of each column should appear on the web site.

Noted Internet/Radio synergist and keeper of the well-regarded Shortwave/Radio Catalog (http://itre.ncsu.edu/radio/), Pete Costello, finds NASWeb a "content-rich radio web site, and I have no doubt that it will promote the hobby and assist enthusiasts from the pre-novice to the DX legends. NASWA should be proud!" Author, NASWA columnist, and WRTH Industry Award winner Tom Sundstrom says, "You must put this site in your bookmark file! With up-to-the-minute information on the Web, and an knowledgable editorial group that's electronically connected, it is a combination that's hard to beat."

D'Angelo adds, "We are also happy to have the opportunity to serve many others who may not have heard of the club before, or who may have heard of it but never sampled what the club has to offer. We hope that upon seeing here a part of what the club has to offer, some of you will take the opportunity to join NASWA in the spirit of our motto, 'Unity and Friendship'."

Congratulations. Susan is a strange name for a dad I think!
Have you played with the scout very much. I have read a little about them but have never seen one up close. Give me an example of where you have used it. Does it pick up local FM and TV stations instead of those secret frequencies you strive for. I have played with the Opto Intercepter and its is junk as far as I am concerned. It receives and hangs on commercial stations too much. You spend all day hitting the bypass key.
Thanks for your time.
Email is a better way to reach me as I don't know where I found this posting!

From: blade@mail.cts.com
Message-ID: <4ca5l9$3r0@news2.cts.com>
Source record: 243611

I am wanting to obtain an antenna for my 2006. Down the road I might want to use the antenna to broadcast in the 2 meter band. What type of rig will perform all of these furntions? I have observed recommendations of using two or more diffrent types of antennas for diffrent functions. I may also want to use the antenna for SW monitoring. What is the best solution and source?

Thanks

Robert

Ummmmm. Isn't that what this newsgroup is all about? To give this info?

It's here to help people get into the scanning hobbie. Not to scare
them away thinking we are all "KNOW-IT-ALLS"

Just MY opinion.

HOLY F***!

Some of us people here are getting very tired of this Bull.

I'll say what everyone else has been saying. TAKE IT TO E-MAIL. We've read enough of your posts to realize your side of the story. I haven't seen any posts from this "Andy Moss" for some time now, but everytime someone asks you to take it to E-Mail, you start in with your "HE STARTED IT" speech. (BTW most of us grew out of that when we were five). Right now I don't really care if your a respected person in the scanning hobby or not (I think your rapidly proving otherwise), this is childish and it has to stop. This is a SCANNING newsgroup, not "HE'S AN ASSHOLE" newsgroup.

I may not know much of the technical side of things, but I do know extremely childish behaviour when I see it.

If your pissed at this good. I encourage you to offer your opinion, but do it through E-MAIL. In case you missed it my E-Mail address is AZ342@Freenet.Carleton.CA. My E-Mail drawer is quite large , so scream away!!

Just in case you aren't on a trunked system. Occasionally mics get stuck or some idiot sits on it. This usually prompts the dispatcher into looking for a "hot mic". If the occurance is as regular as you say, it's probably a trunked system, and the previous responses apply. Remember, intentional interferance is illegal. Even if it means that your interfering with your own department. That is what a dead key would mean. Can't use the channel if it has a dead carrier sitting on it.

Guess again. Both are fools with over inflated egos. Their priorities are evident from the crap that they post. I wouldn't trust a thing that these two idiots say.

I've got over 15 years in the SHF spectrum and worked with techs who deal with equipment working down to the HF and up to SHF. Every time they get on a self righteous trip, I FIRE THEM. I have no use for non-team players.

Nice try. WRONG! What you decribe is exactly what you called it, Freqency
Hopping, not spread spectrum.

One of the Radio wanna-be mags had a nice UNCLAS decription of spread
spectrum. You digitize the signal, slice it up by XORing it with a highspeed
data stream, modulate the carrier with it, and then multiply the freq. The
whole idea is to make the band width as wide as possible. This is the low
power aproach that you were talking about. The hard part is establishing sync
with the decode data stream. Theoretically, multiple transmitions can occur
on the sam part of the spectrum at the same time. Only the receiver with the
correct decode data stream can receive and decode the signal.

However, I think the original post was for telephones. In this case, your
desciption is VERY GOOD.

Hello, do the instructions that come with the AOR-8000 explain
how to communicate with the 8000 via the serial port? By this
I mean opcodes, instructions, arguements, baud rate, parity, etc?
If not, where is ther a description of this? I want to write
my own program and skip the nasty cost of commercial ones. I'll
make it available freely when I am done.

Thanks a lot.

Bruce, I have this scanner also and I hate to tell you that this mod is useless.
The RF circuitry does not exist in the 2021 for 800 MHz. You may want to get a GRE
superconverter, which will simply down convert the 800 MHz freqs into the 400MHz
range that the 2021 CAN receive. This setup isn't as nice as my PRO2006, but it
should work ok.

Hi...

I've had my Uniden BC200 sitting on my desk at home plugged into the re-charger for a while. This past weekend I wanted to use it and I'm not getting any audio at all. Even after turning up the volume and squelch knobs. There's no noise at all.

The channels are still resident in memory and I can select scan or manual mode but there's no sound.

Has the speaker been trashed or is there some keypad reset that has to be done?

Please reply via email, as our site hasn't been receiving any Rec.* or Alt.* groups in the last couple of days...

Thanks...

My 2 cents, for what it's worth.
Thanks to Bill, I have changed the way my scanner works and, thereby
gaining a much higher level of enjoyment out of the hobby.
Also, using his information, I have helped family members & close friends
the same way.
Seems like this guys contributions are contagious. Makes people happy.
I don't see any contributions like this from Moss.
He hasn't made me or any of my family or friends happy at all.
Keep your attitude, Bill; You're a very positive person, which by all
means is what makes you successful.

The following are quotes extracted from mr. cheeks postings today.

_No, asshole, I did NOT write the above......

_Well, dude, YOU are one of the ooze that has slithered up from the
_cracks. No one jumped your case. Talk about "BUTT OUT"! You must be
_one of those messiahs where the rule is, "Do as I say; NOT as I do."

_What a stupid hypocrite.....!

_Pack sand, fella.........

_Yes, I used to enjoy a good rumble. Nowadays, rumbles are pretty well
_not the in-thing and have been replaced by peeing contests. One or
_the other are just fine.......

_Well, actually, I am beginning to think Moss might not be so bad after
_all. Considering some of the other vermin that's been slithering and
_oozing up from the cracks, he's been looking pretty good. Moss never
_did come on to be the Second Coming or the Resurrection.

_Some of the latest ooze comes off as walking on water; jumping into
_their britches two legs at a time; and tying their shoelaces,
_one-handed. Pity.....they're all running a couple of digits shy of a
_Zip Code and a brick or two short of a load.

_Oh, balderdash. TAKE your break any time you want it. THIS ain't a
_factory where you get your breaks by a bell. Just take one and
_exercise one of your basic Freedoms to pick and choose among that
_which you will read and that which you will not.

_"Bill & Andy" my ass. That doode is looking pretty good compared to
_some of the pestilence that's oozing up from the cracks in the
_sidewalk now.

_The term, "shit fer
_brains", was coined at your deliverance from the rectal tract that_served
as your birth canal.

And then theres this morsel, written to mr. cheek from someone he knows.
It sounds a little peculiar, to say the least:

_ He got kinda hooked on you! I was back in Greene County a while back
_and a couple of farmers want to talk to you about a couple of lambs .... Do
_you remember the time Sherriff Mickey Owen caught you and Lester Cox in the
_alley behind the Gilloiz Theater ...

To be continued....

Just wanted to drop you a note and post thanking you for this little tidbit... very cool and useful stuff that's not published so much anymore.

Also thought I'd put in my 2 cents... I happen to have a car cd-cassette converter thing from my discman laying around (the kind that lets you play your discman through your tape deck) and plug that into my car stereo quite frequently. Sure it sucks the batteries of my SC150 a bit more since I end up turning it up louder, but that's what recharging is for (and no, too lazy to go out and find a decent cigarette lighter adapter for it)..

Just one note of advice... when in a fast food driverthrough line.. getting bored and hungry from sitting there too long.. and you tune in their headset freqs... remember to turn your stereo down before pulling up to the microphone... the feedback is liable to kill someone one of these days. :) (ok, so *I* thought it was funny when I accidentally did it the first time.. just dont ask me about the other times)

OK, I'll answer it. Every once in awhile you will see people posting sites
that have a program that decodes the POCSAG information. The hardware costs
only a few dollars from radio shack parts and is relatively easy to build.
If you have no luck finding it, mail me back and I'll give you the site
name. I don't have this prog or web access (which is why I don't have this
prog).

147. FS: ICOM H-16 commercial vhf handheld

Newsgroup: rec.radio.scanner
Date: 1996-01-03 00:00:00 UTC
From: vector@netgate.net
Message-ID: <vector.5.00174553@netgate.net>
Source record: 243387

For sale:

Icom H-16 VHF commercial handheld.

Freq. range: 130-180MHz, 5kHz steps, 16 memory channels
Features: seperate transmit / receive CTCSS squelching
monitor button for open squelch
programmable odd repeater splits
user programmable scan list / forced priority monitoring
transmitter time-out option
transmit inhibit
channels may be labeled from 1 to 99 for synchronization /
ease of use with existing radio systems
external power connection
external antenna connection (TNC antenna jack)
5watts output on high power with supplied battery, 1watt low

This radio is completely user programmable from the front panel using an access code. Programming is fairly simple and it takes only minutes to completely load up all 16 channels. I do not have the original documentation, however I will provide all instructions necessary for care and programming of the unit.

I am selling this radio WITH a supplied ICOM rapid charger and a supplied 1000mAh high current battery (allows the unit to transmit at a full 5 watts). I will NOT sell the radio alone for less money, since i will have no use for the battery or charger without the radio. The radio is in good condition (minor wear) and I have had it in my posession for 2 years. It has been used basically as a fire monitor (hasn't left the house much and hasn't been dropped or used in a firefighting enviornment, save for use as a secondary "scanner" in my vehicle during brush fire photography incidents). MINOR scratches.

The only reason I am parting with the unit is for monetary purposes. Christmas bills came earlier than expected and it looks like I overdid it this year. This has been a good radio to me and has come in handy on many a photo-chasing incident. I hate to part with it, but I really am left with little choice.

Radio, 1000mAh battery, rapid charger.

Asking price: $450

please E-MAIL all responses to vector@netgate.net or...

page me @ 1-800-800-9456 (alphanumeric pager). ask to page GREG STRAMBACK
leave a message with your full name and phone # to return a call to you at.

150. FS: Suped up Icom R-7100

Newsgroup: rec.radio.scanner
Date: 1996-01-03 00:00:00 UTC
From: Brad_White@fforum.blkcat.com
Message-ID: <NOMSGID_1=3A109=2F239.0_960103_100700_181f9a15@fidonet.org>
Source record: 243390

Because of new employment obligations, I am no longer using my R7100, so I'm selling it and the other following items for a package price of $1590. I want to point out that this is no ordinary R-7100. The following mods have been performed on this radio.

* The Deltacom computer interface has been internally installed in the radio with a 9-pin serial socket on the rear panel. All you need for computer operation is a serial cable and software (please note that both the Deltacom and ScanStar Commercial software is included).

* 12VDC coaxial input has been added to the rear panel, thus facilitating easier connection in mobile applications.

* Scan/Search speed up. The crystal has been replaced, resulting in greatly improved performance.

PRICES IF PURCHASED NEW

ICOM R7100 (unblocked 800 MHz) - Current price is $1688. Includes original box, all manuals, AC cord, DC cigarette lighter plug.

MB-23 R7100 Carrying handle - Current price is $11

UT-36 R7100 Voice Synthesizer - Current price is $54 (installed)

Deltacom computer interface - Current price is $349

Registered ScanStar Commercial - Current price is $129

If purchased new this package would cost over $2000, thus I feel my price is reasonable, but still I'm open to offers. Please E- Mail if interested.

151. Cell Thieves Nabbed

Newsgroup: rec.radio.scanner
Date: 1996-01-03 00:00:00 UTC
From: michael@alexander.terranet.com
Message-ID: <michael-0301960518490001@alexander.terranet.com>
Source record: 243433

Interesting article in Wall Street Journal the other day (1-2-96). Although it only indirectly mentions scanning, should be of interest to anyone who likes to listen to cell phone conversations (or to anyone who thinks that e-mail is private)!

Excerpts of the article follow:

(Copyright (c) 1996, Dow Jones & Company, Inc.)

NEW YORK -- Federal authorities, relying on the first-ever court-approved wiretap of electronic-mail accounts, arrested and charged three people with running one of the most sophisticated cellular-fraud rings uncovered so far.

[snip]

The three people arrested included a German electrical engineer and alleged mastermind, Bernard Bowitz...

[snip]

Mr. Bowitz came to the attention of law enforcement agencies because he allegedly peddled his wares on ... CompuServe... An engineer at AT&T Corp.'s wireless unit was monitoring CompuServe...when he came across an advertisement sent to all CompuServe e-mail customers. In the ad, a person who identified himself as Bernard Bowitz, offered to sell illegal cellphone devices to interested buyers, states the complaint.

[snip]

The case was referred to the Secret Service and the Drug Enforcement Administration, and the agencies got permission... to wiretap the e-mail messages between Mr. Bowitz and his two alleged accomplices. Mr. Bowitz, apparently believing that his private e-mail was immune to interception, openly described his transactions -- making it easy for the DEA and Secret Service to track his moves...

[snip]

The equipment manufactured and distributed by Mr. Bowitz is far more complex than gear seized in previous investigations, the agencies said. One device seized was a "CellTracker" phone, which allows a user to eavesdrop on a call being made by another cellphone user. The CellTracker could be used as a potent counter-surveillance tool by crooks who want to tap into the communications of law enforcement officers who may be after them. Another device, about the size of a small book, steals phone numbers when legitimate users place a call. Cellphone crooks typically use far bulkier "scanning" devices. The gadget allegedly made by Mr. Bowitz could

be concealed inside a jacket, letting a user pick up numbers secretly while strolling down a street.

[snip]

The agencies said they also bought several "Lifetime" phones from Mr. Bowitz. Agents said such a phone can be programmed with up to 99 stolen numbers in its memory, a much higher capacity than typical so-called cloned phones.

[snip]

Phones seized in the latest bust also have a startling new capability: They can be conveniently programmed with stolen numbers by simply using the keypad. Devices taken in previous phone busts had to be programmed with a separate, more complicated hookup to a personal computer.

Roger,

I mentioned the VHF freqs because a lot of people aren't aware that they exist. They're usually
easy to find if active because of the narrow bandwith (138-144 25 KHz step). It is common in this
area to have one group of fighters on VHF (Victor) and the other group on UHF (Uniform).

If you can obtain a copy of the current listing of the Air refuelling tracks they will show the
Primary and secondary A/R freqs along with ATC entry/exit control. Also if you can obtain a list
of ATC freqs for your area I believe they will show the UHF ATC. I find most of the freqs that
they are using by simply monitoring UHF ATC. They will usually say something like punch 303.0.
I'm not sure but I think Jonathan Clough @ Javiation sells those lists but I'm not sure.

When I'm searching i generally will use 50KHz steps because it's twice as fast and 25KHz steps
are not all that common. 50KHz is becoming more common though. When monitoring Milair comms I use
a 200 MHz in line highpass filter to eliminate most of the intermod. If you are going to use a
preamp put the filter ahead of it.

Jeff Zeman

P.S. If you happen to see a UHF Helical satcom antenna lying around the base I'd be very happy if
you'd send it to me...

Hey Rob,
You can use the 75 ohm cable to run to another antenna but I've tried hooking my scanner up to a "LIVE" cable service and didn't get anything. The signal that is present is not what the scanner will be looking for from that (as far as I'm told). Take a piece of coax (75 or 50 Ohm) and strip off the outer insulation and ground braid of about 3-10 ft and you can just drop it out a window, tack it up your wall ect and that should help you out a lot. It will depend on how close the TV stations are that you want to listen to.

I use a 3 element scanner antenna I got from Rat Shack several years ago and I pick up everything I could possibly want from it. TV and all.

Hope this does it for you

Greetings to all fellow scanner geeks!

I see that the RS Pro-60 handheld scanner is on sale this month for $250 (that's about 33% off, I think). It's a triple conversion receiver with 800 MHz (no cellular of course), military air band, VOR band, some of the TV audio band, etc. Actual coverage is 30-512 and 760-1000 MHz (-cell).

I'm thinking of getting one. Does anyone know if the Pro-60 is any good?

Thanks for any help!

Andrew Clegg

>Pro-60 is any good?

In short, yes the PRO-60 is a very good scanner. (Your 'From:' line
didn't contain your complete return address so I couldn't respond
via e-mail.)

I published a PRO-60 review in September 1995 Monitoring Times
magazine. The PRO-60 I tested for review drew excessive
current (2 ma) while it was turned off, which drained the batteries.
I'm told the problem was limited to an early batch of PRO-60s.

I think the defect was limited because owners of more recent
PRO-60s report adequate battery life and good performance.

Here's a summary (from the "Buying a Used Scanner" FAQ):

PRO-60: Very good portable made by GRE. 200 channels,
single search range. Similar features and same IFs as the
PRO-43 it replaced but the PRO-60 has wider frequency
coverage and crisper audio. Covers 75 MHz and commercial
FM broadcast bands. Improved Direct search can be stepped
manually in single steps. Uses same 6 cell battery tray as
other high end GRE portables. Railfans take note -- the
PRO-60 and PRO-43 are subject to interference in 160 - 162
MHz range. Draws 100 mA while scanning.

Yes, I used to enjoy a good rumble. Nowadays, rumbles are pretty well
not the in-thing and have been replaced by peeing contests. One or
the other are just fine.......

>Have either of you guys ever thought about a "cage match" to settle this
>once and for all. Might be interesting! Hell I might even be persuaded
>to jump in for the right amount of money.

Well, actually, I am beginning to think Moss might not be so bad after
all. Considering some of the other vermin that's been slithering and
oozing up from the cracks, he's been looking pretty good. Moss never
did come on to be the Second Coming or the Resurrection.

Some of the latest ooze comes off as walking on water; jumping into
their britches two legs at a time; and tying their shoelaces,
one-handed. Pity.....they're all running a couple of digits shy of a
Zip Code and a brick or two short of a load.

I think you better hold off on that cage match.

187. Re: AOR8000 Audio Clipping

Newsgroup: rec.radio.scanner
Date: 1996-01-03 00:00:00 UTC
From: Michael Mayer <mayer@boulder.vni.com>
Message-ID: <30EACAA5.D90@boulder.vni.com>
Source record: 243469
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have come across this AR8000 squelch audio clipping too, but I only notice it when I 'accidentally' stumble on a cellphone call. I don't have the AR8000 bandwidth numbers in front of me, but I checked a while ago, and the bandwidth of the cellphone carrier in our area is slightly wider than the IF bandwidth of the AR8000 in NFM mode. Thus, it clips a little when people talk loud into their phones and there is a strong signal (the FM cellphone signal deviates beyond what the IF filter is able to handle in NFM mode). This IS a pain, since I have to either squeeze the MONI button or turn the squelch all the way down so it does not clip (actually, it still clips, but at least the squelch does not quiet along with the IF clipping). I believe the squelch threshold on the AR8000 works off the bandwidth of the IF in a given mode. I suppose you COULD set your mode to WFM, but you will introduce adjacent channels as well as the audio getting quieter in general.

A variable bandwidth setting on the AR8000 for all modes for individual search banks and individual scan channels would have been cool, kinda like how you can set a custom channel spacing increment currently.

Mike

Since "joe@joe.joe" writes anonymously, I'll have to respond to the
newsgroup.

Which FAA regulation(s) prohibits operation of "ANY" receiver...

If this is the case, why does the FAA publish an Advisory Circular
(ACNo: 91.21-1 for example) concerning use of Portable Electronic Devices
(PEDs) aboard aircraft? Why do certain airlines allow the use of scanners?
Why, at the pilot's discretion, is scanning permitted. The FAA *does*
prohibit transmitters, but I've never seen anything prohibiting receivers,
and I would be grateful if you cite a reference.

The Law Enforcement agencies in my area use Digital Voice Processing (DVP).
They choose when to use it and when not to by the press of a button on
any of their frequencies. It scrambles the transmission for
confidential information regarding juviniles, etc. Also very effective
when pursuing an individual or busting an underage party where there
may be a scanner in operation. When using DVP, all the scanner owner hears
is the same as if you turn the squelch all the way down.

Ryan.

I picked up one of these scanners the other day as the sale was ending on 1/1/96 here in the D.C. area and checked the date code on the scanner before I bought it and it was 11A2 hence November of 92 so I wouldn't think it would be to hard to find a few more that are still modifiable floating around out there! I went ahead and did the mod before I even hooked up the scanner for the first time and it worked fine.

This is not necessarily true. My roomate and I both just bought modifiable PRO-2026's from Radio Shack on sale for $139. The key is to find one that has a date code before April of '94. The date code is a small white sticker on the back of the unit and on the packing box.

I am thinking about getting into WEFAX listening/watching, and I have a few questions.
I noticed that Radio Shack is now offering AEA WEFAX for $99.99. The information that they have about the computer requirements is very vague. I have a Gateway 200 Colorbook Portable computer, with PCMCIA slots. Do I need a soundcard to operate the software interface? Where does the computer interface with the radio? Can it be done through a serial port?
If anyone has experience here, I would appreciate some advice.

Thanks,

Jeff C.

Source record: 243481

I know that numerous police departments go to some lengths to make it harder on scanner listeners. The Richardson, Texas PD near here transmits a long MCW modulated squelch tail everytime a unit un-keys his mike. However, the trunk system immediately assigns the next communication on this "channel assignment" on another frequency. This makes it very difficult to monitor their system unless you have multiple scanners or use ScanStar with multiple scanners.

KG>I have tried this variation on the original keyboard Mod and it does
>not work In fact I visited many RS stores and tried 35+ radios
>NONE of them gave the desired results.

KG>Could anyone comment on the validity of this mod?

Hello Kevin,

Here is what I know.

The above MODS work on code dates on the back of the Pro-51 that are 7A4 or lower... they will not work on 11A4 or any in that range. I have both and know this for a fact...I have been looking for a workable MOD for 11A4 but so for have not been able to find one.

I went to my local Radio Shack just last Friday , and had the salesperson pull out his stock of six Pro 51's and He had four with the 11A4 code on them. I found two that had the 7A4 code. I tried the keyboard MOD mentioned above and they worked on the 7A4, but not on the 11A4. I hate to admit this but I bought one with the 7A4. Now I have two Pro 51. I am sure that someday I will find a way to MOD my 11A4.
So, My suggestion to all you freq freaks is ... If you want a Pro 51 that will take the keypad MOD....go to Your local Radio Shack and ask the salesperson to bring out all of his stock , and open them and see if you can find 7A4 code date or one close to it.
I hope that this helps .

I read recently in an issue of Popular Communications that the GE Trunking system has an "anti-scan" feature that guarantees that the response to a transmission will occur on a different frequency than the original, and that all transmission end with a series of tones and a bit of "dead air" to keep scanners occupied for a short period of time while the response is occurring on another channel.

Can't help you on the Radio Shack guy, however KC5KTO's WWW home page has a
pretty good listing of most common Radio Shack scanners and the mods. The
home page can be found at:

http://rever.nmsu.edu/~weasel/scanner/mods.html

Just capture that html file and print it out for a pretty comprehensive list,
or search online for the specific info you need.

This following message was a private exchange between Bill Cheek and me.
I'm sorry that he saw fit to publicize it since it is of little import
to everyone else on this forum. What he neglects to mention is that I
responded to a private e-mail he sent me of a derogatory nature. Not
surprising, he conveniently omits that fact.

I don't wish to fall into the same cesspole in which Cheek (and Moss)
currently reside. I'll refrain from responding to Cheek's postings and
will henceforth let his messages speak for themselves. Indeed, they are
far more eloquent and revealing about his character than I could ever
be.

: >>:Does anyone know the ten standard frequencies for in-home cordless phones?

sure, try searching 870-896mhz and also 820-850mhz There are also some cordless phones (mobile Phones) in the 454-455mhz as well as the 152-153, 157-158 (IMTS) as well as in the in the 900mhz area. Many of the IMTS phone frequencies are now being used for paging services, though you may still hear some conversations there. IMTS has the advantage over cellular of using higher powered repeaters vs cellular uses lower powered repeaters and mobile units.

I also sometime hear phone patches on many of the Police frequencies. both those using conventional systems and those using trunked systems. normally, there is a channel or frequency reserved for phone patches.

I believe the Airfone (847-850 I think) Have go to digital mode.

Don't give out any sensitive information over any wireless or mobile phone you don't want anyone else to intercept..ie try to avoid giving out credit card numbers on any phone that uses radio frequencies..cordless, cellular..mobile!

if you are interested in the phone frequencies for your area, I'll be happy to supply them!

No problem. If this is the same mod that has been around a while, it will
allow the 800 MHz freq numbers to be displayed on the scanner, but the rest
of the circuitry does not exist to receive 800 MHz.

...while you are at it, you can find a TON of modification info in the scanner section of the Hamnet forum right on COMPUSERVE, without searching the web.

The web has 10 TONS of mods, how can you MISS them? Learn to use a browser and you can help yourself, instead of berating those who suggest that you do. Sometimes, if you find nothing, that means there is nothing to be found on that subject.

This smacks of those people who won't go looking for a job because it isn't as easy as slacking along on welfare. You obviously have access to a computer, so not having the tools is no excuse.

The tone of your original request may have indicated to the respondant that you didn't look for yourself. I too get tired of answering the same questions about information that is all over if you bother to look for it.

Try belden 8261 video cable...the stuff works great and can be found in
trash cans behind most TV stations...or make friends with an engineer at
the station and get some "on loan".

That's what I use and I have found NO difference in 800/900mhz reception
or any other bands with fifty foot plus runs when compaired to 9913.

IMHO unless you are transmitting...9913 is a ripoff for scanner use.

Hello Glenn,

I was reading some general mail and came across yours on the CI-V interface. I am a new user to the internet, the mail system, and scanners. I have a RS PRO-2006, and I was going to modify it with Bill Cheeks CE-232 interface. However I seen a interface by Optoelectronics, and I was wondering if you had any thought which one is better and why? When you talked about the serial interface of the CE-232, I was wondering if that would except the optoelectronic frequency scout (frequency search device). Maybe you can talk about some of the software that is available for both of them, and if the CE-232 is able to read DTMF?

Thanks

Ron Hutton

However I seen a interface by Optoelectronics, and I was wondering if you had any thought which one is better and why? When you talked about the serial interface of the CE-232, I was wondering if that would except the optoelectronic frequency scout (frequency search device). Maybe you can talk about some of the software that is available for both of them, and if the CE-232 is able to read DTMF?

Thanks

Ron Hutton

Now that you mention it I did end up adding a voltage regulator to the circuit.
Drove my cost up 30 cents but it gave me peace of mind about the power
going to the Max chip.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for
mobile use and comes with a cigarette lighter adapter although it can be
hard wired.
It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in
WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies
found in high-end scanners.

Hello Robert,

Your question is very common, and, as an avid scanner type person thast has also been on 2 meters for years, I would STRONGLY suggest two antennae for your work..

The reason is that while receiving antennae can be pretty broad in frequency coverage, the typical 2meter antenna is tuned to run within an extreemly tight bandwidth..

Here is a typical example...

Your average to high quality scanner s capable fo something like 25mhz-1300mhz and, your typical 2 meter rig is designed for 140-150mhz (and that is stretching it a lot!). If space is a problem, look at the isopole 2mtr cone antenna, it is a very good candidate, and it takes little room to set it up... As for a scanner antenna, I like the discone setups, as they allow me to get all the way down to 25mhz.

Good luck!

:>
:>if i use my scanner on an airplane, will it fuck with the navigational
:>system

It is against FAA regulations to operate ANY receiver (TV/AM/FM) on any
commercial flight PERIOD.

Not that I agree with that, but they do have their reasons..

BTW: If you are caught, and they get nasty, you will be met at the next
airport by Uncle Sammy and will be escorted from the plane..

If THEY want to get nasty, they can charge you with willful endangerment(sp?)
of all the passengers. To do this all they have to do is prove that you knew
it was a crime and that the possibility of interfence was there..

It's just not worth it if you ask me...

And, another little tidbit...

If the airline catches you monitoring AIRPORT freqs while on the plane, they
can confiscate your toy. They do not want an 'anxious' pilot yelling at the
tower to be heard and possibly misunderstood by a passenger. The logic is
that you might cause an undue panic... Then Uncle Sammy is waiting at the
NEXT gate for you all over again...

{:->>>telnet to "pods.pacifier.com" (press return 2x) or dial the above to register

Gary.. with my experience I agree with you, I've been all over the world and I have found this...
Larger aircraft have LESS restrictions, You can pretty much operate anything on 747's, 757's, ect.... again, except on takeoffs and landings

The smaller aircraft (Beech, ect) require that you keep all those little electronic devices turned off during the whole flight. But also, different airlines have different rules.
I've operated computers, CD players, walkmans, and even SCANNERS on airctaft with no concerns from the crew (on the larger aircraft)

Ya know... this whole thread started when a guy asked if he could take the thing in the cabin, he wasn't even concerned if he could even use it. He was more concerned with what security would do if they saw it.

{:->>>Jeff Zeman

Thanks Jeff

While I stand corrected on the ability of some of the MIL radios to tune down farther, it is not common in any sense of the word to hear Military Air traffic in the UHF range beyond NORMAL 100 Khz channeling. In my experience in the past 10 years that I've been associating with Active Duty Military pilots (I'm active duty Air Force, enlisted), ALL the frequencies used in the UHF range have only been 100 Khz. Steps beyond that is very rare but no doubt in use. The chopper pilots where I'm stationed at now say they have NEVER tuned their radios to steps beyond 100 Khz and can't recall ever hearing of anybody else doing so.

The HaveQuick radios (which are now being installed in more aircraft) will also be used in the 3 decimal places more and more. Those are the digitally operated ones. SATCOM is also used in the same band and they're tuned mostly to 3 decimals also.

Your area using freqs past 1 decimal is not common at all, (I know that you mentioned it in your one post). And I'm sure that in the upcomming years more and more transmissions will be heard in the 25Khz steps, but most of MY experience is based on past and actual usage of the equipment (to a small extent) in contingency operations and IFE responses.

I didn't mean to leave out the VFH range, I don't consider them mil freqs like I do the UHF range that is set aside for them.

I'll start scanning the 3 decimal freqs in this area and see what I can find. The Guard in the area did get some new aircraft and they might be using the 25Khz steps. Might just give'em a call tomorrow and ask one of the pilots I know there.

Will let you know

Most of the Discone type antennas give great results. I know that Maxrad makes a few various models and another is made by "diamond", who ever that may be. Try calling Amateur Electronic Supply (I live near their stroe in Wickliffe, Ohio) on their 800 listing (Chicago?). They are a very good resource for monitoring supplies.

If you use the wide band mode and feed the audio into
a good amplifier you can eliminate this problem. Also
check your volume and keep it low. If the problem
reduces or goes away than you may have a weak nicad.
The DC voltage to the squealch circuits appears to
degrade as the volume increases. Very slight changes
in the voltage reference can cause the squelch trip
point to shift resulting in breakup of the audio.
The main problem seems to be that the bandwidth is
too narrow and/or the center frequency may be

slightly off causing this problem.

The audio of the 8k definately has a problem in this area at times that relates to all of the above. I find the worst audio when using the SSB mode. Other HT scanners such as the TR-2400 are far better in audio quality.

:>The only way I can think of to scan digital cell phones is to use an
:>actual digital cell phone and hack it.

Good idea, but, not a valid possibility.. The public key encryption will
still require a massive computer to try all the possibilities for the
correct key...

IMHO, forget the digital crap. Someone will come up with a black box someday,
but, I would not hold my breath waiting... There are still 1000 to 1 analog
signals in the cell band for the near future...

>I have a RS discone mounted in my attic with approx. 75-85 feet of Rat
>Shack R58 coax. Is there a better type and/or brand of coax that will
>provide less of a signal loss?

Oh gosh yes! RG-58 absolutely sucks for RF above 10 MHz or so. Get
rid of it, post haste!

For the time, trouble, and money, one of your best bets is RG-6
satellite cable....with gold plated Type F connectors on each end.
Use a gold plated F-to-BNC adapter down at the scanner end and
whatever is needed up at the antenna end. Be sure to weatherproof all
antenna fittings, though.

RG-6 is 75-ohm cable, but even with the natural 1.5:1 VSWR, the return
loss will be a LOT less than the attenuation of RG-58. RG-6 is good
coax....and worth the money.

Above that, you're looking at Belden 9913 or the very expensive
hardline cables and even more expensive connectors. The quick fix for
the least money and trouble is RG-6 as described above.

Rgds,

Bill

> Jon Ayscue
> ayscue@stsci.edu

A mobile extender extends the talk range of the officer's portable radio by rebroadcasting his portable radio transmissions back through the more powerful transmitter in his cruiser, to the radio at the police station. This is preferable to having the repeater antenna back at the station try to pick up the portable radio transmission directly. Usually, your best bet for hearing radio traffic is to set your scanner to listen on the repeater output frequency of the whole radio system, rather than the repeater input frequency (or mobile extender frequency). The repeater output simply has more range.

Mike

Rob-

What you need is a capacitive link coupler. Make one. If your cable system is like 99.996% of the others, you have a piece of rg59 coax with an F conn on it..build a little mini-box with a female F input, a .01pF coupler cap and a BNC output to run to your scanner's antenna input. The impedance mis-match will not be much of a problem. You may also want to add some attenuation to the input, Rat Shack sells inline F connector units that add 5-10-15 or 20 dB of input attenuation. This will lower the signal level so you dont swamp the scanner's input stage. Or take a look at the Radio Amateur's Handbook, there are circuits you can build to add attenuation in steps using garden variety resistors and switches. Built into the same mini-box, this makes for a professional installation of a coupling device.

Note that a similar setup will also couple your home satellite system's LNB to the input of a scanner that is capable of 800MHz-1.3GHz...and you may also find interesting signals on your cable system in this range.

*****standard liability disclaimer*****
WARNING! DO NOT attempt to directly connect your scanner to any home or pro satellite LNB without a capacitive link! Doing so may destroy the LNB, your scanner and or the satellite receiver! If you are not sufficiently savvy with electronics to built the coupler I have described - SEEK ASSISTANCE!

Generally, I think most people would agree with you. HOWEVER, there are an increasing amount of "children" who jump on the newsgroup, leave a vague message like:

"Hi, gotta go, are there any mods for my Horsecrap 2000 CB Scanner? I really want to listen to 800Mhz on it too. Please send me everything you got E-Mail, as I don't have the time to check in here too often.

JerkWeed"

Demands for customized information delivery services from people who don't really identify themselves or their specific requirements do not deserve any OTHER sort of response.

How DARE anyone think the people here are a personal library. Search the Web and help yourself. If you can't find it, then nicely ask here like a human adult.

My opinion, anyway.

Steve

256. Meanings of various codes

I just got a Radio Shack PRO 2040 for Christmas and have been having a great time listening to tons of neat things! I got hold of the 1996 edition of POLICE CALL PLUS BEYOND POLICE CALL and it doesn't explain all the different code. I know that a 211 is "robbery in progress" but that's about the extent of my knowledge. I love in Rockland County, NY and can receive many New York City transmissions, and would appreciate hearing from anyone who could supply me with, or tell me where I can get, the code breakdowns.

Many thanks,
Bobb Strong (bobb9091@j51.com)

First off...

Welcome to(or welcome back to)rec.radio.scanner!

Let's get straight to business....

Many of us have the 2004/5/6's with fading EL displays and I for one have not seen any real solutions for a good fix. The problem with a 2004 display is not being able to get a replacement from RS.

Now before the displays in my 2006's go dead...should I "stock up" on displays while they are still available???

What about CPU's for the 2006's???

We want to keep these radios going for as long as possible. What advice do you have for us???

Thanks for your input...

Actually it's a clone of the Camnis HSC-050 ... an update of the AR1500 by
the common manufacturer of all these models, Nissei.

In favor of the TR2400, one can say that it's a slightly better reciever
than the AR1500, and has a vastly improved user interface.

Can't comment on the accuracy of the 20 digit number. But later versions of
Scan*Star for Windows will allow you to enter the code and (if correct) your
2035 will be unblocked while under computer control.

The DEMO versions have this capability: www.scanstar.com.

Soooooooo, you expect me to be a prostitute, I gather? Meet your expectations or else "suffer" your ill-will? Put a price tag on "credibility" and "respect"?

Not a chance, pal. You find out what the score is and THEN make a judgment; else keep your peace. Part of the score is that I am here to deal with the lying, connivving, slanderous, low-life accusations Moss has been spraying all over the Net about me. I got accused by others of being afraid to meet him here in public. So here I am.

I am NOT here for business or to sell anything. In fact, I am buying. And I am NOT under any circumstances going to prostitute myself to meet your expectations. I just checked my birth certificate, and your name is not on it. Neither are you sleeping with me or paying my bills. So I am not about to play some little charade and pantomime in the IMPOSSIBLE attempt to meet a huge variety of differing expectations and demands.

I quit that game a long time ago. You just think of me as you wish, and if put to the test, I'll defend your right to do it, regardless of the polarity of your thinking.

I will NOT, under any circumstances, however, acquiesce or bend to your thinking. Unless I miss my guess, you have a hard enough time thinking for yourself without taking on the responsibilty of mine.

Take a nap on this concept at the very least. Please.

Bill

>display is not being able to get a replacement from RS.

>Now before the displays in my 2006's go dead...should I "stock up" on
>displays while they are still available???

Tandy National Parts seems to have purged their inventory of spares
for the PRO-2004. They have a policy of supporting equipment for five
years after it goes off the shelves. The 2004 departed this earthly
realm in 1989. The 2006 departed in 1994, more or less. That would
suggest you have three more years to make up your mind.

I think they stop replenishing stocks sometime in the 3rd year,
though. So get 'em while they last; double-seal them; and maybe even
put the spare EL panels in the refrigerator to slow down any chemical
aging process. I'd get a couple of spares anyway. The 2006 EL panels
seem not to crap out as fast as the 2004's, but they do weaken with
time.

>What about CPU's for the 2006's???

<shrug> I've only had to replace three of them....two that I blew up
myself, and one for someone else. Failures are always due to
monkeying around. At $60 or so, I'd think twice on it, UNLESS you
were adventuresome enough to try adapting one to a PRO-2004.

>We want to keep these radios going for as long as possible. What advice
>do you have for us???

Well, EL panels mostly. The CPU is specific enough that it is a
concern, but chances are you'd never need it. So how about drumming
up ten guys or so and taking out an "insurance policy" by kicking in
$6 or so each and buying one for the Cause. First guy to blow his
gets it. Even then, it ain't likely to ever be needed. After 2-3
mods on the Logic/CPU Board, you're done and the risk-taking is over.
If you haven't blown a CPU by then, you're not likely to ever.

There are some unique little widgets and gidgets in the PLL area.
That X-301 is one. It can be used for other things while you're
waiting for one to blow. (Frequency standard!)

Otherwise, anticipate the areas in which you'll be working, and maybe
stock up on a few critical parts....though most everything in these
scanners is pretty generic aside from the CPU and EL Panel. I even
bought a handful of X-301's straight from TEW for other purposes.

Oh.....a spare faceplate and top/bottom covers could be smart!
The beauty of the PRO-2004/5/6 series is that it is so generic and
roomy and semi-standard.....later models like the PRO-2035 and 2042
are drifting away from that concept.

So whatcha think?

Happy New Year, BTW!

Bill

Here are todays offerings. On 1/4/96, Bill Cheek said the following:

_Soooooooo, you expect me to be a prostitute, I gather?

_ Part of the score is that I am here
_to deal with the lying, connivving, slanderous, low-life accusations
_Moss has been spraying all over the Net about me. .

_I am NOT here for business or to sell anything.

_ I just checked my birth certificate, and your
_name is not on it. Neither are you sleeping with me

_ You just think of me as you wish,

_I will NOT, under any circumstances, however, acquiesce or bend to
_your thinking. Unless I miss my guess, you have a hard enough time
_thinking for yourself without taking on the responsibilty of mine.

_Same "permission" that Hitler got to rule the world;
_just on a smaller scale is all.

_ I'll ignore both of you...

_ Nor do I recall anyone extending an
_invitation to you to participate.

_you're threatening to IGNORE us when you should have
_continued that from the very git-go.

_Sorry, pal, but I just don't understand you....

_ Makes me
_wonder about their family tree with no branches and an extremely
_limited gene pool.

_What a jerk! "Free information" and "buying my books"
_have no relationship whatsoever.

_Talk about "suckups", maybe you're a Moss-suckup, no?

_Anything I can settle for you? Any lingering questions? Any
_uncertainties?

_Are you one of those who are going to run me off or put me out of
_business? (Feel free to say "yes"..........

_two can play your game. Moss is fixing to find out. Makes me no
_nevermind if you want in on the action, too.

_Get straight with me or run, fella. Or.....if you think you can stand
_the heat, then stay in the kitchen and fight.

_The choice is yours.

_YOU dished it out, and then couldn't take it. THAT is the bottom
_line, fella.

You might want to put a diode in series with the regulator input if it
does not have "reverse battery protection". Most 3 pin regulators will
clamp their output to a diode, protecting the stuff down stream as along
as they can. The extra diode takes care of that problem without
stressing anything. The dropout of the diode can be a problem, so make
it a 1n5817.

>Idan

According to my information, the 2034 doesn't even HAVE 800Mhz capability, so you can't modify it to pick up something you don't have capability for.

Your only chance with that scanner would be to acquire a converter (Ramsey or Grove) that converts 800-900 Mhz and outputs 400-500 Mhz to your scanner.

Source record: 243395

The police department in Medina, Ohio used to scramble all of their transmissions around the time that I moved to the area 4 years ago. They eventually dumped the scrambling and now transmit in the clear. I had heard from someone at my job who is a volunteer fire fighter that the local police dumped it in order to make communications between several local agencies and themselves easier.

With the ever increasing popularity of scanners, I am suprised that more law enforcement agencies are not looking at scrambling their transmissions. Think about how handy a scanner with the local law enforcement frequencies punched into it would be to a burgular robbing a home. It definately puts the local police at a disadvantage in trying to apprehend such an offender.

My personal feeling is that any agency that wants to "secure" its transmissions from public monitoring has the right/responsibility to scramble its own transmissions. It is a hell of a lot more effective than the rediculous "protection" that cellular phone companies got with the Electronic Communications Privacy Act of 1986 (and subsequent legislation) that resulted in it being illegal to import or manufacture scanners capable of receiving cellular frequencies. Millions of scanners that do receive those frequencies are still floating around - I have two such radios. I'm sure that the majority of the owners of these radios don't avoid the cellular bands simply because they are illegal to listen to.

"Any signal that hits my antenna, is mine to do with as I please!"

- Sam KC8BQP - Medina, Ohio

>diffrent functions. I may also want to use the antenna for SW
>monitoring. What is the best solution and source?

I own a 2006 and am a Ham. I used the Radio Shack Discone for a
couple of years and found it to be ok for both. The SWR on the 2meter
band (fed with 75 Ohm Coax!) was 1.4:1. The antenna does not exibit
any gain in Tx or Rx but is functional if you only want to put up one
antenna for both scanner and 2M.

The Discone advertises 25 MHz and up but the performance is marginal
on the band edges. Nothing beats an antenna tuned for the particular
band you want to monitor or use.

Hope it helps...

de Glenn, KE3MF

P.S. I now use a Radio Shack Ground Plane and a preamplifier for the
scanner and a homebrew 5 element Quad for 2M.

HAMFEST/COMPUTERFEST CALENDAR 1995/1996 - NORTHERN ILLINOIS
last updated December 31, 1995 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@att.com. Thanks to Dennis Dale and ARRL for providing information.

JANUARY 1996

Jan 21 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

Jan 28 (Sun) - Wheaton Community Radio Amateurs hamfest. The Odeum exposition center, Villa Park, IL 8am-2pm, admission $8. For info call (708)545-9950. Adv tickets are $6. For adv. tickets write WCRA, P.O. Box QSL, Wheaton, IL 60189 Very crowded, somewhat overpriced indoor hamfest.

FEBRUARY

Feb 18, Sunday: Rock Island, IL - Davenport Hamfest, Info, SASE to Kent Williams, 4245 10th St., East Moline, IL 64244. tel (309)796-0718.

Feb 25 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

MARCH

Mar 24 (Sun) - Computer Central, Harper College (see notes at the end of this article).

March 24, Sunday: Sterling, IL - Sterling-Rock Falls Amateur Radio Society hamfest 96. Info, call Lloyd Sherman, (815)336-2434.

March 31, Sunday: Grayslake, IL - LAMARS hamfest, Lake County fairgrounds. Info: Francis Avellone, W9GLO 650 Green Bay Rd., Lake Bluff, IL 60044, tel (708)234-4124.

APRIL

April 21 (Sun) - Moultrie ARK, Arthur, IL. Info: Ralph Zancha, WC9V, PO Box 55, Lovington, IL 61937, tel (217)873-5287

April 28 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

MAY

May 11 (Sat) - Kankakee Area Radio Society, Peotone, IL. Info: Willis Bowser, K9IFO, 1210 North Riverside Dr., Momence, IL 60954-3452, tel. 815-472-2079

May 26 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

JUNE

June 1, 2 (Sat & Sun) - Starved Rock RC, Princeton, IL. | Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 Usually an excellent hamfest, | with sellers from Illinois, Iowa, and Wisconsin.

June 9 (Sun) - Six Meter Club of Chicago, Willow Springs, IL. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Ave., Downers Grove, IL 60516-3925 tel: 708-963-4922.

Jun 30 (Sun) - Computer Central, College of DuPage (see | notes at the end of this article).

JULY

Jul 28 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

AUGUST

August 18 (Sun) - DuPage ARC, Stickney, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517. tel: 708-985-9256.

August 25 (Sun) - Vermilion County ARA, Danville, IL. Info: * Gary Denison, KA9SKS, 14704 East 2750 North Rd., Danville, IL 61834-5610. tel: 217-759-7389.

August 28 - 30 - Antique Radio Club of Illinois, Elgin, IL. | RadioFest96. Holiday Inn Holidome and Convention Center, | 345 River Road, Elgin, IL 60123 Ph. (708)695-5000, | (847)695-5000 After 01/20/96. Info: Jeff Aulik, 1708 | Parkview Ave., Rockford, IL 61107 or Carolyn Knipfel, RR 3, | 200 Langhorn, Morton, IL 61550.

SEPTEMBER

September 8 (Sun) - Bolingbrook ARS, Joliet, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517, tel: 708-759-7005

September 13-15 (Fri, Sat, Sun) - Peoria, IL. ARRL National Convention. Info: Ron Morgan, KB9NW, PO Box 3508, Peoria,

IL 61612-3508, tel: 309-694-2649

Sep 29 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

NOTES - Computer Central shows

Computer Central computer shows are held at the College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

295. REQ: Scanning database recommendations

Newsgroup: rec.radio.scanner
Date: 1996-01-04 00:00:00 UTC
From: dean@defcen.GOV.AU
Message-ID: <4cfmra$a0l@helotrix.defcen.GOV.AU>
Source record: 243403

Can readers please post recommendations for a database
I can use to organise my scanner frequency list.

Ideally, the database should have fields for freq,
date of intercept, user id, callsigns, notes and
a reference field for tape id if I have recorded
the intercept.

As my scanner handles 5kHz to 1.3 GHz, no breaks,
the database should allow all these frequencies to
to input.

Unfortunately, my scanner can not download to a
computer, so no auto-software please.

Do you routinely log any other info on a freq ?

The programme needs to run on an IBM clone, using
Windows 3.1 or DOS, and can have upto SVGA graphics.

Last but not least,
it should be freeware or reasonably priced
shareware.

Thanks for your assistance ... Deano

296. Re: Help:is this a CB scanner?

If the lcd displays a frequency it is almost certainly an amateur radio.
If it displays a channel number it could be either ham or commercial gear.
Please post the model #, I'm curious. BTW, you don't need to have an
amateur license to own or listen to amateur radio gear, just to transmit.

-
Jim Dean, KD4USF NCZN58B@prodigy.com

Yes, I've done it and it works. Don't worry about a mismatch, since you are receiving and not transmitting. The signal is strong enough to overcome any mismatch.

>tr2400, .5mhz- 2gighz scanning receiver. would really like to know if
>it is the clone of a more common model. any info would be appreciated.
>thanks, john WA7RZF, portland, or

I may be mistaken, but I believe that the Trident TR2400 is either a functional equivalent, cousin, or exact match to the AOR1000XLT or AOR2000. It will also probably related to a Fairmate model too. I believe that all of these came out of the same factory at about the same time, and look alike if you cover the name at the top.

You might find out for sure by checking the Javiation WWW home page, or E-mailing Jonathan Clough at Javiation (if he doesn't step in on his own and confirm or deny what I suspect)

Invasion of WHOSE privacy? Your signals "invade" my airspace when they enter my property! If you don't want me to exercise my right to know what type of radio signals have entered my home, either encrypt your signals or figure out a way to keep them off of my property!

303. Paging service transmits my number to random pagers

Newsgroup: rec.radio.scanner
Date: 1996-01-04 00:00:00 UTC
From: Tom Becker <gtbecker@rightime.com>
Message-ID: <30EC1E84.2EE7@rightime.com>
Source record: 243411

Ever since I moved to a new house and got a new phone number, I've been plagued by folks returning
"my page".

Someone, or more likely some thing, is transmitting a three-digit repeating pattern to apparently
random pagers; pager users think is a phone number and I get the call. I don't think I've heard
from the same person twice.

I've determined that the pagers are from a variety of dealers; I've tried to identify a common
system, but most pager users are not technically saavy so it's been difficult to get much help.

One paging company technician says that it is not possible to eliminate the transmissions since they
don't - and presumably can't - examine all transmitted data to screen out a particular pattern (my
number, for instance), and they can't determine the source caller if it's not an in-house glitch
that sources the data.

This has been going on for four months and shows no sign of abating.

Does anyone have a good suggestion to try aside from changing my number?

TIA

Tom Becker

From: mead@teton.rtp.dg.com
Message-ID: <4cgsik$nc2@dg-rtp.dg.com>
Source record: 243416

I have a 2006 and have used it with:
G5RV sw ham antenna
Diamond X510 2m/440 ham antenna
Ringo 2m/440 ham antenna
Diamond disconne (sp?)

Without question the disconne works the best for scanning. The Diamond disconne also has an advantage in that it works relativly well for transmit on many of the ham bands. I frequently use mine on 440 and 2m. The disconne is a great first antenna. I understand that the RS disconne is made by Diamond but lacks the vertical which enhances reception on the lower frequencies. It is about $50.00. The Diamond disconne is about $95.00. Diamond antennas are well made with quality hardware.

According to the meter on my 2m/440 rig, there is about a 5 s-unit difference between the disconne and the X510. The difference does not seem to be as big on transmit judging by some simple tests I have run.

Hope this helps,
glenn

>Jeff C.

I have no experience with the AEA device. You might want to check out
JVFAX 7.0 at the AMSAT ftp site. It is also at the oakland ftp site
I think) It is a shareware(no minimum fee-kind of freeware).
You would have to build a simple(single op amp, 3 resistors and a
capaictor mounted on either aDB9 or DB25 connector that will mate
to you comm/aysnc/serial port). The software is world class.
You will need a stable sw radio regardless of what type WEFAX converter
you use. I use a Kenwood R2000 and it works great. I have an older
Panasonic RF2200 that is a great voice mode sw, but is just to
unstalbe for any image/data reception.
Good luck and viewing.

316. Motorola Metrocom 2

Newsgroup: rec.radio.scanner
Date: 1996-01-04 00:00:00 UTC
From: kacst26+@pitt.edu
Message-ID: <4chnsc$s5q@usenet.srv.cis.pitt.edu>
Source record: 243424
Cross-posted to: rec.radio.scanner,alt.radio.digital

HELP! I am desperate, but not desperate enough to pay for it.

Does anyone know anything about Motorola Metrocom 2 equipment?
Specifically, I'm interested in the encode/decode format that is used
for transmitting messages over the airwaves.

Brief background: Metrocom 2 systems are used for transportation systems
such as buses and taxis and allow the vehicle itself to report problems
to a central dispatch location without driver action. It also allows
the central dispatcher to request voice communication with the driver and
vice versa. Systems use an SPU (Sensor Processing Unit) to interface to
the vehicle monitoring equipment. Faults, such as low air pressure,
emergency stops pulled, etc. are sensed and fed through the SPU to the
main metrocom 2 system which includes the vehicle id number, location (if
available on that system) and encode this for transmission over a radio
link to the central dispatch. The central dispatch then takes action
as necessary.

My problem: I work with such a system which is rapidly approaching death,
at least parts of it. Motorola no longer supports this equipment and
having it repaired is expensive and unreliable. I can't afford to replace
all of it at once with an entirely new system, so as individual vehicle
units die (or worse yet, the central dispatch system crashes and burns
beyond repair), I'd like to replace just the vehicle units or central
as needed. I am able to build systems that can perform this function and
supply my own radios, but without the protocol, I'm stuck. I've studied the
protocol by painstakingly looking at captured audio waveforms and can convert
them to binary form, but I can find no correlation between them and what I
know to be in the messages; I suspect that some kind of encryption or at
least data manipulation is to blame.

Your mission, if you decide to accept it, Mr. Phelps: supply me with the

Uniden BC-8500XLT desktop scanner for sale. Covers 30 - 1300 MHz (minus cell and UHF TV). 500 memories, alphanumeric display, named memories, tuning knob in addition to keypad. Controls external tape recorder; program each channel to turn on recorder when channel is active. These sell for $380 new. Mine is mint, in the box with manual, warrenty card, antenna, and AC adapter. Asking $250. Thanks.

Mike, N4PDY

Would YOU like for me to post the e-mail that I wrote to you? Ok,
here it is. Let's see just what is so "derogatory" about it?

==========
From: michael@alexander.terranet.com (Michael Alexander)

MA> Of course you're going to suck up to the guy since you're
MA> looking for free information rather than buying his book.

What a jerk! "Free information" and "buying my books"
have no relationship whatsoever.

Talk about "suckups", maybe you're a Moss-suckup, no?

So what's your beef with me that causes you to wage a Moss Campaign?
Anything I can settle for you? Any lingering questions? Any
uncertainties?

Are you one of those who are going to run me off or put me out of
business? (Feel free to say "yes". I love a straight up challenge,
pal!)

Cute piece of work, Michael. I don't recall ever doing anything to
you. Keep it up without giving me a chance to put it to rest and two
can play your game. Moss is fixing to find out. Makes me no
nevermind if you want in on the action, too. The more, the merrier.

Get straight with me or run, fella. Or.....if you think you can stand
the heat, then stay in the kitchen and fight.

The choice is yours. <shrug> Just be straight about it, ok?

Bill
==========

THAT was in response to not only your nasty initial responses to me,
but to the little campaign you started to wage behind my back. Shall
we get into PROOF of that, my fine feathered friend?

>I don't wish to fall into the same cesspole in which Cheek (and Moss)
>currently reside. I'll refrain from responding to Cheek's postings and

>will henceforth let his messages speak for themselves. Indeed, they are
>far more eloquent and revealing about his character than I could ever
>be.

Well, be that as it may.....you jumped out of nowhere into this foray.
YOU dished it out, and then couldn't take it. THAT is the bottom
line, fella.

You had no call to jump in saying the things you said...and not expect
an equivalent response. Your own character is succinctly revealed, I
daresay..... No one provoked you, fella. You just jumped without
looking........

Bill

: I don't think you need to find out how to read the pages that go to the
: 1000000's of Alphanumeric pagers out in this world! How world you feel if
: you had a pager and other people were reading YOUR messages??????

Don't worry. The encodeing will not allow this without great effort on the persons part that wants to monitor. They can no doubt buy a little black box from some off the wall place that will do what they want. Just a matter of time.

The thing that people need to keep in mind is that ANY form of cordless communications is a security hole. No matter what the law says you will find someone that will want to break that law and monitor anyway. Just read about how the hounds jump on any message that has anything to do with cell phones. Since they don't care, or have some kind of attitude, they degrade the hobby. You can prove this by doing a simple study. When someone gets a new scanner, watch the news group. The FIRST mod they ask for is the cell mod. Then pop over to the rec.radio.swap group and look for the scanner sales. The big thing that will sell a scanner is if it can do cell phone.

Denny, you know that they are already monitoring your pager. Someone out there has already figured it out. They have been watching pages since before you got your pager. The best way to get back at these people is to watch what you have sent out. Don't give them the thrill of the invasion of your privacy. Simply don't say anything that intrests them.

The Pro 2021 was not designed to receive any 800 MHz signals. Clipping a diode or a resistor allows th radio to display 800 MHz but the radio does not have the internal components necessary for 800 MHz reception.

Unfortunately most NEW scanners have their allowed freq bands coded into
the scanner CPU, making it almost impossible to change. The PRO 2021 that
he was asking about, however, is an older model that doesn't have the
800 MHz RF section.

Hi Evan

Always glad to hear from someone in Lil' Rhody!!!

It won't be long and you'll be glad there is not constant chatter as you discover your local police, fire & rescue and other interesting frequencies to monitor. You may also want to monitor your local ARES and RACES groups also.

If you set one of your memory banks on local services, you can lock out all the other banks and let your scanner sit on, and hear the action that is close to you as it is happening.

Although they are different in each area, the firechiefs control HT is a good frequency to monitor during a fire and includes the person to person chatter at the site. EMS and paramedic to hospital frequencies are also interesting sometimes.

You'll get the hang of it real quick!

Like you, I have found most of the callbooks totally useless as far as finding the really nitty gritty good stuff. Police dispatchers get boring, I like the car to car chatter the most.

Hi all.

I am in need of a frequency list for the Tucson, Arizona, police department. I have a few, but am missing some and have been unable to figure out the exact purpose for some of the ones I do have. If anyone has this info and would be willing to email it to me, it would be very much appreciated. For that matter, most any current list of city/county/state/federal frequencies active in the Tucson area qould be most helpful.

Thanks in advance for any help.

RE: EL displays for 04 and 06

I recently replaced the display in my 2006. As an experiment I
connected it to one of my ailing 2004's to see if the EL panel was
electrically compatible. No problem. The only physical difference is
that it is maybe 0.5 inch shorter than the 2004 EL panel. Better than
nothing!

>{:->>>Roger,

I deleted a lot to respond to the original post.....

Long before I had one of the first FRG-9600s the local military UHF mil freqs were in 25 KHz steps. Some of the confusion arises from the fact that a lot of the mil radios in use could only operate with 100 KHz or 50 KHz steps. Although YMMV in your particular state, here in Kalifornia there has been ample military activity to expand into 25 KHz channel spacing.

I wouldn't ignore the mil VHF range either as I have discovered many odd operations in progress operating in AM in areas I wouldn't previously have expected. One operation at 138.5 MHz and another at 65.05 MHz come to mind. In a similar vein I first became aware of UHF FleetSatCom military activty by accident when I DF'ed a strange signal and had to point my L-P antenna up into the sky!

The 800 Mhz systems have been used in Florida for quite some time. Some
are fully trunked and some are not (ie. Plantation, Broward Fl.)

Just because you see the applicatation for licence and/or frequencies
does not mean that those frequencies are being used.

The Florida Highway patrol at this time I believe operate on at least
three bands. One being the 800 Mhz from what I have heard is trunked and
digitized making it useless to the scanner. Most departments will operate
on their orinal system and new system for a while until they work out the
bugs and ensure that all "units" have the upgrades working.

Do not discard those frequencies! One day you will find that the activity
on the old channels has dimished or dissappeared and you will find that
they are making the switch.

It is also wise to check thr local paper since there is usually a story
concerning the changeover.

Good luck and HAPPY SCANNING!!!!

You are assuming that when you use your scanner on an airplane that it is working properly. Your receiver could malfunction and you might not know it - and the crew might know you are using it.

I am cursious as to why you mention that you don't listen to AM or FM broadcast frequencies, but (I assume) you listen to others.

Many cable systems also introduce a DC current. Rat Shack sells a
cheep DC block that you might want to add.

Why not purchase one of the adapters on the market that plugs into the Radio antenna and then plugs into the headphone jack of portable CD players & other portable audio equipment as well. I have a Sparkomatic unit that is about 8 yrs old & works fine. Also the newer models have the capability to tune in several different freq's as well.

I always find it usefull to use an existing piece of hardware "as-is" or modify it slightly to do what I want it to do. This always saves me the agravation of esigning a PC board & etching it and soldering everything on the PCB. All the while HOPING it works.

Does anyone have the 800 freqlist for Orlando ? Orlando is in the process of converting to a trunked system so we need to reprogram our scanners until we can get our 800 scanners system reprogrammed once they are offically online with the new system.

Most of the police and fire depts. In this area allow us to have our 800 radio system programed with their channels on a scan only basis.

Thanks JH

: that you might cause an undue panic... Then Uncle Sammy is waiting at the
: NEXT gate for you all over again...

You really should tell the airlines about this. They're letting people
listen to them AND putting it in writing!

Evidently, there has been some changes since you got this info.

If I remember right, it was always up to the carrier (the airline, NOT
the pilot on an individual flight).

How 'bout posting the regulation you mention above?

From: tunaman@telerama.lm.com
Message-ID: <4cjbkm$9ld@pink.lm.com>
Source record: 243295

Good Day!!
I'm selling my ICOM R-1. Now, I'm sure most of you are familiar with this model, but, just in case you're not--it's like this. It features continuous coverage from 530 khz to 1300 mhz. It's about the size of a pack of cigarettes. It's got a 100 channel memory, parts of which can be used to block birdies and null signals in frequency searches. (Very handy when looking for new signals.) It sounds pretty good for something so small--but it can easily support an external speaker for fuller sound. One of the handiest features I've found about the R-1 is it's looks--when I go through customs, they don't question it. I turn it on, I move on. I saw a guy recently held up for two hours because he had a 2006. (He was with me, btw.) The programming features several interesting setups that make scanning much easier. I like this scanner a lot, but I have two others, and the R-1 is spending most of it's time waiting for someone to turn it on. The package I have includes the R-1, it's long stainless steel antenna and a short rubber ducky, the charger, and if I can find it, it's leather case. I don't have the extended battery--but they're easy to find at Grove or anyone else who stocks ICOM. If you're interested, e-mail me at:

tunaman@telerama.lm.com

>it be done through a serial port?

The unit connects through the serial port: there is a small dongle-like unit (you can use the serial port for other uses) which features a cord with a minature plug on it that you connect to your receiver.

Works very well...

I have received a number of e-mail requests for more information about my "Verifier" after I posted the above - I guess I should have expected that.

I haven't used in quite a while and I can't find the documentation for it. I took it off the shelf today a fired it up to see what it displays - it says Hark Systems, Inc The VERIFIER. Copyright 1990. (It's been around for a few years). I can't find any information on the unit that says where Hark is located. It can attached to a Shinwa mobile scanner (literally bolted together and wired to the radio's discrimator).

I don't know if these are still available. I don't remember where we got it. It was three or four years ago, and I didn,t order it But I do remember it costing several hundred $ at the time. We used as a piece of test equipment when we were doing upgrades to our private network. We only get it out now for trouble shooting.

In addition to the copyright information that comes up when I power it on there is also the following "warning": IMPROPER USE OF THIS DEVICE MAY VIOLATE THE PROVISIONS OF ELECTRONIC COMMUNICATIONS PRIVACY ACT THROUGH INTENTIONAL UNAUTHORIZED USE OF PROTECTED RADIO COMMUNICATIONS. Seems Hark just wanted everyone to know that.

Hello,

http://www.ibmpcug.co.uk/~g4sgi/

Announcing my home page on the WWW which contains the following
radio related resources of interested to domestic radio enthusiasts,
shortwave listeners and scanner users alike:

Working Aids:

1. An HTML version of the popular Foreign Language Recognition
(non-English) working aid for shortwave listeners. Information
about foreign language characteristics with tips on how to identify
over 40 languages. Download the original version in Windows Help
file format (.HLP).

2. International Bandplan. Listing of the radio bandplan for all
three regions of the world. dc to daylight!

3. Modulation. A comprehensive description of the modulation schemes
used by radio systems including AM, SSB, FM, FSK, PSK and data modes
SSTV, HF FAX. A useful introduction that will help you get more from
your radio. Useful information for data modes enthusiasts.

4. Radio Propagation. An explanation of radio wave propagation
including ionospheric propagation. This is an introduction to radio
propagation phenomena for the beginner and expert alike. Suitable
for anyone interested in knowing more about how radio signals
reach them.

5. UK Medium wave and VHF Band II stations. This is a complete list
of all UK medium wave and VHF broadcast stations to be heard in
the British Isles. Extracted for my data base, this text file gives
the name of each station and its frequency.

Software product information and demos:

Read about control software I have written for the Icom 7100 and
Yaesu FRG-100 receivers. Download a demo of AOR Searchlight, the
definitive Windows control application for the AR3000/AR3000A.
Download the old favorite DOS control program for the Yaesu
FRG8800, PC-MONITOR v4.03 - this one is fully functioning and FREE!

Trivia:

Not to be out done, I have also included a list of links to my
favourite WWW radio related sites, British comedy sites, coke
machines (inevitable really) and you can even download a midi file

of music I have written (ear plugs not included).

Enjoy!

Simon

On on hand, it is not helpful to scramble the transmissions because in
the town I used to live in, the police would regularly catch someone
because and officer is listening on a scanner, heard the call and was
able to be in the right place and make the nab.

The other hand is like you said, the bad guys can listen too.

>and I would be grateful if you cite a reference.

You might want to check out:

ftp://oak.oakland.edu/pub/hamradio/docs/misc/scan.airline (dated June 1995)

It clearly states that FAA regulations _allow_ scanners (but NOT
transmitters). Most of the airlines state that all electronic devices should
not be used during takeoff and landing, but they list a bunch that CAN be
used at other times, and scanners are usually among that list.

You are only seeing one side of the story here guy. Plus you repost of something someone else
has written is lame, unthoughtful and just plan boring. Plus you have added and fabricated items
in those posts. This is not your argument, shut up and do something useful. Read the FIDO net's
and all will come clear.

If you have AC91.21 I'm surprised you don't have FAR 91.21 which
spells it out in detail.

91.21 PORTABLE ELECTRONIC DEVICES
(a) Except as provided in paragraph (b) of this section, no person
may operate, or may any operator or pilot in command of an
aircraft allow the operation of, any portable electronic
device on any of the following U.S. -- registered civil
aircraft:
(1) Aircraft operated by a holder of an air carrier operating

certificate or an operating certificate; or
(2) Any other aircraft while it is operating under IFR.
(b) Paragraph (a) of this section does not apply to --
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers;
(5) Any other portable electronic device that the operator of
the aircraft has determined will not cause interference

with the navigation or communication system of the
aircraft on which it is to be used.
(c) In the case of an aircraft operated by the holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

In addition there are other constraints to operating even approved devices below 10,000 ft. AGL in air carrier operations.

>and I would be grateful if you cite a reference.

This is true! Also, the FAA does NOT prohibit the use of AM/FM
radio's (such as walkman's, discman's, etc). They DO "prohibit" their
(portable radios) during such things as takeoff and landing, so that
if anything should happen to the plane, and the stewardess' are
shouting instructions, you can hear them (and not the Metallica
playing from your walkman).

Also, depending upon the conditions, the pilot has the right to
restrict the use of such thing as portable computers; due to the fact
that many older portables exhibit something the FCC calls "radiated
emissions" which can screw with instrmentation, radios, etc.

Get some adapters from Radio Shack, and don't worry about the mismatch.

Also, don't forget that TV audio is wide-band FM, not the narrow-band
stuff. If you can receive the FM Broadcast stations (88-108mhz), use that
setting for TV.

Evan@saturn.net (Evan) wrote:

Evan,

First: Assuming you are using the antenna that came with the unit get a better antenna!! Get the $10 Radio Shack Whip for starters and listen to specific bands to start building your list. Then get a better all around antenna Like a diamond RH77CA.

Second: Investigate whether or not there are any 800 mhz 'trunked' systems in your area. They are usually quite active. I believe Police Call explains trunked systems. There are also usually many active MED channels in a city/suburban area as well.

Third: Depending on where you live ie: elevation, obstructions from line of site to major cities, you should tune in places other than your immediate surroundings. You may be surprised as to what you can pick up.

Fourth: Try an outdoor antenna at home. A decent discone antenna would be a good affordable start. You will see a monster difference from the rubber ducky that came with your unit.

Also: You have a nice scanner. Use the search facility to search certain bands and listen carefully to what you pick up and start building your list. You will find alot of stuff. Buidling an active list takes time and dedication but is part of the fun of the hobby.

Try to get your hands on a document called 'Frequently Asked Frequencies' and have some fun with what you learn there. I know its on Compuserve in the HAMNET forum libraries. Air frequencies are also very active.

Stick to it!

I just wanted to pass along a kudo for one Radio Shack and a raspberry to another. I just recently purchased a Pro 60 from RS in my town. I asked about a list of local frequencies and was told I had to buy their large book of national or regional listings. I passed on that deal. When I passed another RS nearby I stopped in and asked about a sheet of local freqs. The guy there happily gave me a sheet listing all of them in the area and the 10-xx codes. I certainly know which store will get any future business.

> very vague. ...

Jeff,
The AEA connects to a serial port. Actually it is a 25-pin
feed-thru connector, so the port can be used for other things
without un-installing the AEA device. If you have only 9-pin
ports, you may need a 25 - 9 pin adapter.

Regards,
Rolf

P.S. I've been using it for about two years now, works fine...

I'm no burglar, but I wouldn't want to have a scanner with me when I'm
trying to be as quiet as possible, wanting to hear anything that goes
on around me while I try to go unnoticed.

Anyway, here in Holland messages about burglaries 'in progress'
are sent to the patrol cars using a computer terminal, very
well encrypted indeed.

>Millions of
>scanners that do receive those frequencies are still floating around -

Ahem.. yeah right..

>
>
>"Any signal that hits my antenna, is mine to do with as I please!"

Partially.
Here in Holland you can receive whatever you want, but you are not
allowed to use de-scramblers to decode encrypted messages.

Still, the only way to keep channels secure is: Don't use them.

Thanks, Paul, for noticing that. Believe me, I do not wear a halo, nor flap about with wings of gleaming white, but doggonit, I NEVER initiate a personal disagreement with people. If someone says something that's potentially annoying, I leave 'em the hell alone to think for themselves.

If someone posts a technical error, then I may well become involved, because I am eminently qualified to set the record straight, but I won't denigrate or attack the person; just set the record straight.

Other than that, I do not initiate negative mail to people. Not e-mail, and not public mail. I really do believe in Freedom of Speech and Freedom of the Press.

I really appreciate your noticing that one thing about me.

>If I didn't agree with what he's said, I'd say "Bill, I don't agree
>with you", and explain as best I could why in a civilized manner.

>It really is as simple as that...

And you can't beat that methodology with a stick! Nothing wrong with that whatsoever. But then you apparently understand virtuality a lot better than some folks who confuse it with reality.

Thanks again,

Bill

He's correct. A .01 uF cap is the correct one. The 75 ohm resistor, if you
choose to add one, should be a very low wattage carbon composite type, like,
1/4 watt or less!

The time has already come. I have had a "Verifier" for a couple of years
that I use to monitor paging. Decodes numerous formats (tones, golay,
pocsag, etc). It's a black box that I can configure with filters
including only showing messages to specific pagers.

Right out of the box, turn it on program it, it works. All you need is a
dumb terminal to connect to it.

>scanner that features receipt of police "mobil extenders". Can anyone
>tell me what mobil extenders are and how they work?
>
>thanks
>
>Jon Ayscue
>ayscue@stsci.edu

Howdy,

As the first poster has said the mobile extender is a second radio that is in the patrol car. When/if the officer is using his hand held set the mobile extender picks up and relays this transmission to the base unit. In other words the range of the hand set is extended, and dramatically so.

I believe that the thrust of your question really had more to do with just how this would.could apply to you. Or, more to the point, can this signal be detected and used to perhaps "spot a cop"? In my experience and opinion the answer is yes ... and no. Any receiver/transmitter device _does_ transmit a detectable signal. So, yes, the mobile extender can be detected when it is powered on. However, by the time you are close enough to the mobile extender to be able to "detect" it's presence you have more than likely _already_ been detected. :o(

The "hype" put out by some advertisements state otherwise and perhaps the "hype" is correct. I am _not_ a radio [or other] technicial expert. I _am_ however a retired trucker that spent years using scanners in an attempt to be aware of just what was happening on the highway[s] around me. The opinion[s] stated above are based entirely on the experience gained during these years and miles. [Almost 5,000,000 of the latter :o(]

One more thing you should be aware of if you are not already. There are several jurisdictions in the USA wherein the use of a radio receiver capable of receiving the frequencies used by the police is _seriously_ frowned upon. Seriously enough that if apprehended using a scanner you will be locked up! In some jurisdictions even just _possessing_ a mobile scanner whether using it or not is suficient to get you an appointment with "His Honor". You may wish to check with _reliable_ sources regarding the applicable laws in whatever part of the country you are contemplating using a mobile scanner.

Cheers :o) cws

401. Finding frequencies: slow going at first? --frustrated newbie!!

Newsgroup: rec.radio.scanner
Date: 1996-01-05 00:00:00 UTC
From: Evan@saturn.net
Message-ID: <4cib5p$7ul@titan.saturn.net>
Source record: 243380
Cross-posted to: rec.radio.scanner,alt.radio.scanner

So I just bought my first scanner today (RS Pro-60), and I'm
having a helluva time finding decent frequencies. Maybe I set my
expectations too high, but I somehow figured that I'd find a good
number of frequencies that had semi-constant chatter. What I'm
finding is that even those frequencies that come in clearly and are
interesting have *looong* pauses. I'm mainly interested in
Police/Fire/Rescue, and I've searched for what seems a fairly
reasonable time now (in Providence, RI), and I've only really found
about 10 that are even close to active. Is that just the way it's
supposed to work? I've also been looking through Beyond Police Call,
and the vast majority of those frequencies don't appear to work at
all. Anyway, the scanner cost me $300 when everything was added up,
and it's got something like 200 programmable channels which, the way
it looks now, will never come close to being filled up.
I'm sure I'm mistaken about this....again, I have no idea
about how this is supposed to work, but I sure could use some
encouragement. :)
BTW, every now and again, I hear what sounds like Morse code.
is it?
Any comments appreciated....please e-mail if it's no trouble.
Thanks!!

--Evan

I agree for overall performance a discone is excellent. Radio Shack sells
one for about $ 59 BUT you can make one yourself with stiff solid copper
wire a small pvc cap and a hot soldering iron for nearly nothing and it
works great. I'd be glad to give you some dimensions..John (WU5Z)

>I have a RS discone mounted in my attic with approx. 75-85 feet of Rat
>Shack R58 coax. Is there a better type and/or brand of coax that will
>provide less of a signal loss?

Looking at a Standard Wire and Cable catalog, you can find the
following data:

Coax Attenuation in dB per 100 feet
Type 100 MHz 200 MHz 400 MHz
==== ======= ======= =======
RG-174/U 8.9 12.2 17.4
RG-58/U 4.6 6.9 10.4
RG-8/U 2.0 3.5 4.6
RG-234/U 0.13 0.2 0.29 (3.3 inch dia, semi-rigid)

The Radio Shack stuff is unknown quality. You would have to sweep the
cable to see what it does. If you stick with Belden, Manhattan,
Standard Wire, Carol, or other known manufacturers, chances are the
above specs will be close. BTW, beware of the crummy RG-8 coax out
there. RG-8 should have a diameter of 0.4 inches, not 0.2 inches! The
RG-234 is not recommended. Connectors probably cost more than your
scanner.

Dang, I overlooked your post originally. But in a review, I saw
something interesting.........

>I remember back in the mid '80's hearing you on CB ch 23 in San Diego on
>Saturday mornings...the meth users had the channel the rest of the
>time(g).

Ahhhhhhhhhhh sooooooooo, indeed. That was out in Spring Valley. Man,
I got so tired of the drugs and the drug runners on the band that I'd
do anything to chap their hides.

>I think that usenet is just like the cb is...there is a lot of
>crap...but those of us who scan for a living need this group to get
>those little "morsels" of information that keep roof over our heads and
>food in our kids mouth.

Yepper......it is CB at its finest....better than the microphone in a
way. And as is so typical, there's always a messiah or a channel
master who figures he's got all the right answers..... It's become my
hobby to toast those rascals...... and you remember what a "rascal"
was, right? (A goodbuddy with chapped lips......)

>Some people take things WAY to seriously...there are "givers" and
>"takers" in this world.

>The "givers" know who they are....

>The "takers" know who they are....

Oh, I dunno.....there's some out here who don't know who they are.
Or forgot.......in the haze of the drugs......

>I must warn you though(you probably allready know this)Once the "noise"
>settles down a little...be prepared for a flood of questions from those
>of us who REALLY want to enjoy scanning on another level.

Yes, I know. Just doing a little sweeping first....you know, making a
clearing and getting rid of the vermin and the slime so everyone can
have a nice place to sit around the campfire . It's a jungle out
there, and the monkeys are a little excited and disturbed at my
presence.....new guy on the block and all. Just like on CB..... The

wannabee somebodies are sniveling and gnashing their teeth, afraid they're going to have to move over.

Gawd, Mark, I've been this route so many times now I just carry a broom and some inspect spray with me where ever I go. It's old hat now and very, very predictable. We'll be settled and having a good time in another week or so.

What was your handle in the olden golden days of the band?

Bill

>Is this so? Is there a mod to show true carrier levels?

Dunno what you looked at, but detect the input of D-33 through a
separate diode detector; filter it, and you'll have approx 0-1vDC
of analog representation of the carrier.

Bill
> So your saying its the "lcd" display itself that is breaking down. These
> are not replacable with other displays?

> ps. i mean literally unsoldering and putting in other displays

No, I didn't say that at all. The EL panel wears out.
The chemicals break down....

The LCD display should last the life of the scanner
unless it is broken or mistreated with environmental
extremes.

{:->>>==

Hey Matthew, here's the info you need as far as I can remember reading about it in "Police Call" and in my scanner manual. Hope it helps you.

Find the intermediate frequency of your scanner (check the specs page of the manual for the IF) it can be around 10.7 / 10.8 / ect. Take this and double it to 21.4 / 21.6 / ect and subtract this from the signal you suspect is an image, if it's the same as one of the published frequencies you normally listen to then you have an image frequency..

example... One of the freqs I listen to where I'm from is 154.800. I also get a (slightly weaker) signal on 186.600 (21.8 higher)

I made a database that automatically calculates the IF for me for all frquencies I use and if I find a new freq while scanning I'll check the IF list also to see if it's in there.

: <BinHex GARBAGE deleted>

1) Since many people on the net don't use Macs, they don't use BinHex decoders. Therefore, they will not be able to decode it.

2) Assuming you are on a non-mac platform, it is probably in ClarisWorks or some other propreiatary format, making it equally as useless to a non-mac platform.

Moral of the story: post in in plain text.

Just my two cents (US, of course), and then some.

Roland:

The Van Nuys area of Los Angeles is served by the Los Angeles City Fire Department. All 24 of the LAFD's 800 MHz (non-trunked) radio frequencies are listed at the LAFD Internet Web site. Set your Web browser to URL:

http://www.ci.la.ca.us/dept/LAFD/index.html

Go to the "About the LAFD" section, and choose "Frequency List". In the Van Nuys area, the most active -local- frequencies are 3,8,10 and 17.

Sorry, but I can't "officially" help you with the PD frequencies. I might suggest that you consider one of the many excellent -local- frequency directories available at area Hobby Shops and Electronic Stores.

Happy Monitoring!

THAT takes effort. Best way is to just don't read what you don't want
to read. It's not at all complicated or difficult. It might require
a modicum of self-control is all, but no effort..

Oh...." back to radios"? What do you mean by that? I see by your
signature line that you are a ham, a private pilot, and a union
member. One could readily assume that you have a fair level of
intelligence.

So what makes you whine " back to radios"? The newsgroup is chock
full of radio articles. Can you not see them? Do you not have the
self-control to skip those articles of no interest to you?

What is the problem? There are 16,000+ newsgroups. Do you read them
all? Of course not. How do you reject the 15,990 or so that don't
interest you? I sure don't hear you sniveling over THAT. So reject
the several dozen messages in this newsgroup that don't interest you.
It's just as easy.

Geezus Hortense Kriste, guy!

boakley@dfw.net wrote:

Pardon me for posting this on the newsgroup, but my reply is
of wide spread interest from which others might benefit.

BO> On the EL pannels, has anyone identified the actual part that
BO> causes the dimming?

There is no part that "causes" the wearing out of the EL panel.
EL means "electroluminescent", which is light generated by largely
an electrochemical process. Chemistry at work "runs down", just
like clock springs; batteries; acids; PC board etchants; combustion;
etc. Entropy.

BO> Is it not possible to repair these panels?

No. The EL Panel literally runs down and wears out. Early PRO-2006's
came with a DIMMER switch; later ones with the on/off switch for the
EL light. There was no evidence that even a reduced voltage
(therefore, a dimmer light) increased the life of the EL panel. The
less it is used, the longer its life. Repair is replacement.

I have long had an unimplemented and untested idea to replace the
EL Panel with a frosted glass slide.....like an oversize microscope
slide, but frosted, behind which could be two or three "grain of
wheat" incandescent lamps, or perhaps like the PRO-2035 & PRO-2042, a
row of high intensity LED's. The frosting would diffuse the light to
give a fairly pleasant and effective back light for the LCD display.

It's probably not worth a major effort so long as there are
replacement EL Panels available for the PRO-2006 and PRO-2005, but for
the 2004, it may be the only solution since the size differs and there
are no more replacements of which I am aware. In 3-4 years, the
PRO-2006 may require such a solution when Tandy stops stocking the
part.

My frosted glass solution would probably be expensive. I am looking
for frosted acetate or plastic to serve the same purpose of diffusion.
If you or anyone else has any good ideas to this effect, I'd like to
hear them.

>internal heat build-up, and improve reliability and life expectancy. I have
>seen several 2005/6 scanners with deformed top covers (from internal heat
>build-up), and personally have repaired one where the internal transformer
>failed and proceeded to cook the scanner.

Likewise, I have repaired one of these scanners where the transfomer
failed. PRO-2004 as I recall. Could have been a 2005 or 2006,
though. T-801 is marginally ample as it is, for a DC drain of about
400-mA at 12-v. When you hack the scanner and add a number of other
current paths, notably LED S-Meters, etc, then the current
requirements can double. Poof! Goes T-801.

Cut down on heat? Hah! Powering from an external DC source
effectively eliminates heat accumulation altogether. Look at it this
way, 12-v @ 400-mA is about five watts. Eliminate the hysteresis
losses of the transfomer which probably goes to 15-watts, it
is no wonder the scanner runs at ambient temperature, inside and out,
when the AC supply is not used..

You're right.......I didn't think of this one because I remove the A/C
power supplies from all my scanners as one of the first things to be
done in a massive hack attack. That being done a long time ago,
out of sight - - out of mind was the buzzword. I remove the A/C
supply for the obvious reason of elminating the major heat source, but
also to create MUCH more room for hacks and mods.

Again, you're right - - eliminating the A/C supply is probably the
single most effective thing one can to do increase the longevity of
the scanner. Any external DC supply will do, so long as it is rated
at 1-amp or more with a voltage of 10-16 volts. Regulated is not
critical, since the internal 12-v A/C supply is not regulated either.
(The scanner has regulators for all its critical circuits anyway),
but with the low cost of the LM-317T adjustable regulator, and
fixed 15-v regulators, it makes sense to make or use an external
regulated supply if possible.

One other thing for the PRO-2004, PRO-2005, PRO-2006, PRO-2035, and
PRO-2042.....and maybe other scanners, is that there is a resistor in

series with the external DC power jack, the purpose of which is vague and indefinite, but probably to act as a fuse. This resistor is: R-256/PRO-2004; R-249/PRO-2005/6; R-223/PRO-2035, a value of 1-ohm rated at 1/2-watt. I have seen this resistor burn out time and time again. Ideal to parallel it with another 1-ohm @1/2-w resistor, or just jumper across it altogether. Use an in-line fuse outside the scanner, rated at 1 or 2 amps, for better safety.

>The major design flaws of the 2005/6 series (in my opinion) is the "always on"
>AC power supply

Well, that is on purpose for two reasons: improved safety by not having 117-VAC running though the scanner, and also so that the memory battery need not be unnecessarily drained, even when the scanner is turned off. So long as the scanner is plugged in, the "always on" power supply feeds IC-9 and keeps the memory battery asleep, inactive.

Seems hokey, but really, this aspect of the design is not a flaw. Both purposes are well served at no real cost. So the key thing for those who convert to external DC, don't turn off the DC power feed. Memory batteries will last a lot longer that way.

Rgds,

Bill

It does not stand up well to modern high-end portables; but for $90 I
suppose you got a bargain.

As I remember the AR900 (and their notorious US distributor; since
changed) was the reason that Grove stopped carrying the AOR line.

> are not replacable with other displays?

> ps. i mean literally unsoldering and putting in other displays

No, I didn't say that at all. The EL panel wears out.
The chemicals break down....

The LCD display should last the life of the scanner
unless it is broken or mistreated with environmental
extremes.

434. Re: CHEEK DAILY DIGEST(street final)

Newsgroup: rec.radio.scanner
Date: 1996-01-06 00:00:00 UTC
From: tcolgan@mail.eden.com
Message-ID: <4cl5a8$lj4@boris.eden.com>
Source record: 243204

I'm right! You're wrong! Am not! Are too!

I'm getting sick!

I don't know who's right or wrong. Since I have no ego or personal involvement in these matters, I'd like to try and look at them objectively and put them in perspective.

From my observations comes the inescapable conclusion that some people participating in an assinine discussion actually believe they're doing something important and are acting like adults. Unfortunately, their childish antics wastes our on-line time and attention. And, unlike real life, we can't send them outside or to their rooms until they learn to play well together.

It's clear to me there won't be a winner in any of this because this newsgroup isn't a court where FACT -- not personal opinion, animosity and general BS -- carries the day. The people who think one side is right and the other wrong will likely continue to think the same way regardless of what's posted here.

In my profession, I facilitate strategic planning meetings for groups, both large and small. I've learned that when you begin hearing the same comments a second or third time, it's time to move on. So, take it to email, guys, and send your comments to folks who have concern about your issues!

Reposting Bill Cheek's comments in digest form? Get a life! Peter, would you mind terribly if we send email to your postmaster at postmaster@teleport.com complaining about you reposting Cheek's supposedly "vicious quotes," along with copies of your postings. Seems fair to me,, because you can't have it both ways. When you repost the quotes, you're guilty of the offense you charge him with.

tc

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have one the AEA Wefax demodulators and it works great. You DO NOT need a sound card just a serial port and the ability to run the software. You will need a receiver capable of receiving the proper Wefax freq's.. The demodulator requires only the audio from the receiver. I hope that helps..
Mike

439. Re: Scanner freq.'s for Boston, Ma. (PLEASE!!!)

Message-ID: <4cl768$4jr@hopper.acm.org>
Source record: 243211

> ... the date (at least the year) that the Electronic Communications
> Privacy Act was amended ....

ECPA - Electronic Communications Privacy Act of 1986
(P.L. 99-508, approved 21 October 1986)
Amended 18 USC 2510 & 2511
Made it an offense to listen to cellular, voice paging, aux. broadcast,
subcarrier, microwave, encrypted or proprietary modulation transmissions.
It specifically exempted cordless from the ban.

TDDRA - Telephone Disclosure and Dispute Resolution Act
(P.L. 102-556, signed 28 October 1992)
Amended 47 USC 302 (Communications Act of 1934)
Required the FCC to end certification of cellular capable scanners, i.e.
ban their import or manufacture as of 26 April 1993.

Digital Telephony Act
(P.L. 103-414, signed 25 October 1994)
Amended 18 USC 2510 & 2511
Added cordless phones to the ECPA ban.

hmmm ... it would appear that October is a bad month for scanner laws.

The first thing you need to do is get a real news reader. Netscape
is the best web browser (ok ftp also), but thats about all. Try
NewsExpress or Free agent. They have a lot of advantages over
Netscape, including kill files.

Help. I have a nine month old Bearcat 3000XLT. It doesn't clearly receive the Norfolk police any more. For example, one of the frequencies is 859.9875. It used to sound fine. Now, the voice is garbled. I put the unit in search mode between 859.000 and 860.000 and set the step to 5 Khz. Then I mannually searched up and down. The transmissions became clear at 859.990, 859.995, and even 860.000.

What's happened? How do I get it fixed?

455. How I would improve the AR8000

Newsgroup: rec.radio.scanner
Date: 1996-01-06 00:00:00 UTC
From: "Ralph T. Adamson" <adamsonr10226@www1.utech.net>
Message-ID: <30EEED70.7FD1@www1.utech.net>
Source record: 243225

If I was AOR, I would improve a fantastic radio by:

1. Use embossed letters on the keyboard
2. Offer 0, 10, 20 and 30 db attenuation (programmable by channel)
3. Create a base port, (like a charger) for charging and for computer control. The computer interface is fragile at best. I installed a couple of sub-mini jacks on the lower left front case for computer control using the CX-12. It was tedious and works well. The downside is that these arent sealed type jacks and the chassis breathes. But for indoor use it works great.
4. A metal chassis would be nice. The stock chassis is pretty flimsy.

You can download a Scan*Star DEMO from www.scanstar.com (Signal Intelligence
home page). SS has almost all options available in the demo, but does not
allow freqs with ODD MHz -- 460.1 is OK but 463.1 won't scan in the demo.

I would add one item that would improve longevity and reliability that Bill has probably long ago dealt with himself and didn't think about.

Run the scanner from an external 12Vdc source and forget about plugging it in the wall if it sits for long periods without use. This will cut down on internal heat build-up, and improve reliability and life expectancy. I have seen several 2005/6 scanners with deformed top covers (from internal heat build-up), and personally have repaired one where the internal transformer failed and proceeded to cook the scanner.

The major design flaws of the 2005/6 series (in my opinion) is the "always on" AC power supply coupled with the plastic case (which by itself was a step backwards). You can't do much about the case, but you can run it off an external DC supply without a single modification, and this will result in a much happier owner in the long run.

Just make sure it is a GOOD 12Vdc supply, well filtered, and if you are so inclined, regulated for an additional smidgeon of protection. It runs so cool this way compared to "normal" that you just KNOW the scanner is happier!

Go BACK to Radio Shack and buy a copy of the "Police Call" book for your state. Then, just by READING you can look up all of the frequencies you might be interested in in your area, program them all up, then only scan the programmed frequencies.

This way, you won't waste time scanning EVERY conceivable frequency, only those that actually may get used in your area. Since a large percentage of exchanges for police and public service are short, you will catch more conversations this way. Be sure to turn on the scan delay feature so you won't miss the replies too!

The law is 18 USC, Section 2510, Title 18, Part I, Chapter 119.

The date on the listing at the Cornell WWW Law site says 3 Jan 1995, but I can't guarantee if that's the date of enactment or what. It's probably real close though.

Check out the site at:
http://www.law.cornell.edu/uscode

A very handy reference!

>The Radio Shack stuff is unknown quality.

I got some Radio Shack RG-8/M, whatever the heck that is! I'll check a few of my own sources, but does anyone know the difference between the RG-8/U and RG-8/M? Just a different dielectric? It is the smaller diameter stuff... I only got it because I figured it would be better than the RG-58 junk I had... of course I'm only using 10 feet of the stuff for an indoor scanning antenna!

I also saw one of Bill Cheek's posts about using 75-ohm RG-6, used for cable/satellite TV installations. How would that compare to RG-8/U or RG-8/M?

Thanks in advance!

From: alioth@ix.netcom.com
Message-ID: <4cktdn$33@ixnews8.ix.netcom.com>
Source record: 243256

The Communications Act of 1936 made it legal for one to receive (and listen to) any electromagnetic transmission that one was able to receive. Anything. One was prohibited from disclosing what one heard or using it for personal gain. I am out of touch with current law. It has been suggested that laws passed since 1986 have modified this freedom. My question is ... to what extent and are these laws constitutional? Can one listen to cell phones? Can one listen to portable phones (46MHz, 900MHz etc)? Can one decode encrypted transmissions? And so forth ... Does anyone out there in Internet land have a current summary of what we may legally do and what we may not? Thanks guys and gals and regards to you all.

I am looking for a high end scanner/receiver.
Please drop me a note on what might be available
and the condition, etc.

Mainly looking now at the ICOM R7000 or R7100 as I have
heard lots of good reports. Don't know too much about
the AR3000 still but have heard some good reports.
I might also be interested in the ICOM 100 if one
is available.

Thanks for all those who have sent me their suggestions.

Hi fellow radio enthusiasts!!
I am new to this newsgroup and I need some advice concerning the purchase of a scanner radio. I figured if you experts in this newsgroup couldn't help me...who could? Anyway, here are my questions:
First: Does anyone know anything about the Radio Shack model Pro 2040 scanner?? I know it is a new model, and I would like to hear anyone's opinion of this radio before I purchase it. Is it a good rig, is it a "stinker"? Let me know your opinions, ok? Also, any suggestions about other scanners in this price range would be greatly appreciated!!
Second question: Does anyone out there have a (reliable) listing for frequencies in the Grand Rapids, Michigan area? The listing in Police Call is VERY limited and some of the frequencies are completely inaccurate!! (I am using the 1995 edition!!)
Well, there it is folks. Send any and all replies to my e-mail address or post them here.
Nice meeting you all...talk to you all soon!!

73!!

One more time..........

The radio doesn't cover this range because the first i.f. is around 600
MHz. That was chosen because there is nothing interesting there. It needs
that frequency range for the i.f. to make it a better radio than the ones
that can cover that range. Stick with the good radio.

>electrically compatible. No problem. The only physical difference is
>that it is maybe 0.5 inch shorter than the 2004 EL panel. Better than
>nothing!

How about height? PRO-2006 EL panels measure 82mm x 25mm while the EL
panel for the PRO-2004 measures 103mm x 28mm.

You're right about "better than nothing" but we gotta come up with
something better. The "looks" with that smaller EL panel in a
PRO-2004 leaves something to be desired, IMHO.

>I got some Radio Shack RG-8/M, whatever the heck that is!

Colloquially referred to as "RG-8 mini" but really has no relationship
to RG-8 other than both are black and both are coax.

>does anyone know the difference between the RG-8/U and RG-8/M?

No relationship other than mentioned above. RG-8/M is also market as
RG-8/x in some circles. It was developed back in the heyday of
Citizens Band, 1975-1980, probably for that purpose. It's not used in
any other serious circles of which I am aware.

>I only got it because I figured it would be better than the RG-58 junk I had...

String between two tin cans is better than RG-58........

> of course I'm only using 10 feet of the stuff for an indoor scanning antenna!

At 10-ft, RG-58 is acceptable up to 1 GHz or so.

>I also saw one of Bill Cheek's posts about using 75-ohm RG-6, used for
>cable/satellite TV installations. How would that compare to RG-8/U or
>RG-8/M?

RG-6 is superior to both, especially at UHF frquencies.

Someone previously posted this question but I never saw a response. A few weeks ago some of the police frequencys became silent. I know that they recently
moved to a new location.

If anyone has any information on the West Allis police frequencys please E-mail me at - mhenning@execpc.com

Thanks,
Mark Henning

495. Radio Shack Sale has two cellular scanners

Newsgroup: rec.radio.scanner
Date: 1996-01-06 00:00:00 UTC
From: ap201002
Message-ID: <ap201002-0601961359090001@cis-ts2-slip8.cis.brown.edu>
Source record: 243280

The current radio shack sale has two scanners that are easily modifiable for cellular. The pro-46 $169, and the pro-51 $199

For the pro-46 ask to see the scanner put in batteries and turn on the scanner while holding down the lockout key, and 2, 9. Then seach through the bands that appear if one reads 888.??? then this unit has not been fixed and you can manually search the entire 868.95-896.1 cellular band. Look for units with a three digit code (found on the back of the unit) of prior to 11A4.

For the pro-51 which I just purchased these are harder to find. Ask to see the unit put in batteries. Turn on the scanner holding down the Band key, and 2, 9 the scanner will go through a start-up mode, while its doing this hold down lockout and 2, 9. The scanner after 2 seconds will stop and frequencies will appear. Type Manual 23 if this reads 888.??? then this scanner has not been fixed and you are all set. A word to the wise, ask to see at the display model, almost all stores have not sent this model back for reconditioning.

Better hurry at those prices they won't last long

good luck

So what do you care? You're off topic as often as on, anyway.
Good job of sucking up, though.

>**** I did not want to respond to Mr. Cheek publicly but ****

I'm sure you didn't, m'boy. So long as you thought I wouldn't come up
here to confront you, your jaws were like a tuba horn.

>**** There will be no response from me except as noted.

Naturally. The suckup role fits your style now. You NEED "approval"
of the herd before you can function. Heh heh heh.....

>Fiasco? (BTW, my call is VE3YES. I've held only one call in my life)
>On numerous occasions I've mentioned my machine on the Fidonet and Inter
>net. Big deal. Used to run? The machine is still active and offers the
>best coverage in the Toronto area.

So you say. Other hams in your region say different. They also talk
about the ruckus and dissent you cause.....and the RFI caused by your
repeater. Who's right? You? Or them? I dunno..... (yet).

>Bill, what exactly have you done for the betterment of radio?
>Rip off a few mods and declare yourself "Mod-God"?

Why don't you get DOWN and specific with that one? One, I have NEVER
ripped (plagiarized) the creative work of others, and I don't declare
myself anything.....except your Maker and Master. So get specific
with your accusations and quit talking shit in circles.

>Publish a few books full of errors?

Full? Hardly. Occasional? Sure. It happens, some out of ignorance;
some out of mechanical failures; some totally beyond control. Just
like in the Encyclopedia Britainnica and on your Birth Certificate.
But full of errors? Nooooo. There you go with the libelous bullshit.

> Piss off the FCC?

Beg your pardon?

> Milk your WSR readers for every cent you can?

Get specific with that one, too. Otherwise, you're slinging shit
again.

> Well, what have you done?

Literally? About 10,000 times anything you've done. No, Candida, the
more legitimate question is WHAT HAVE YOU DONE? My record stands
without any legitimate challenge. Yours is.....non-existent. You are
in no position to question my record unless you're looking to ride my
wave instead of one of your own. But then you don't have the balls to
ride your own wave; nor the skill; nor the merest wisp of ability.

>Anyway, you'll NEVER have a ham repeater of your own will you Bill?
>Amateur radio license notwithstanding.

Hard to say. Maybe not. It's not an issue. If ever I do, it won't
be a rogue 'peter like yours.

>> Into a little S & M are we? heh heh heh heh heh..... How about
>> your police record? Should we get into that any time real soon?
>> Never forget that police records are PUBLIC records, Andy m'son.

>Yes, I have quite a profound police record. Numerous parking infractions
>and one speeding ticket (15KMh over the limit). Clearly you have NOT
>checked my criminal record because I DON'T HAVE ONE!

Izzatso? Should we get into details? I should think you'd prefer
not, and since it's not germane to the subject for now, we can let it
ride. The coup de etat can come later, if you like.

>and leaving you wide open for a civil law suit.

Really now? You might be looking in a mirror......

>Yourself on the other hand are no stranger to being on the WRONG side of
>the FEDERAL US GOVERNMENT.

Well, Mossy Baby, there's where you don't understand our ways. You
see, most decent Americans are ever on guard against the Federal
Government. We think we have it bad.....but you Canadians who
CAN'T keep your government in check, are a sorrier lot than us. And
it doesn't take ME to say that. Every Canadian I know is sick of
being taxed and legislated to death.

> YOU should be concerned with "matters of public
> record". Make sure your own yard is clean

It IS clean, Mossifer! Slicker than a whistle. No skeletons in this
closet.

>Your yard is filthy. You will NEVER play CB radio EVER AGAIN.

Ha ha ha ha ha ha.....you gotta be shittin me? Who says I ever quit?

> You will NEVER have a ham radio

Oh? Do tell.....

> and you will NEVER be allowed to run a repeater - period!

Strange? There is nothing to stop me, aside of having better things
to do for the time being. Maybe some day. Maybe not. But not
because I can't.

>although we have an excellent janitor I am not this person. I work in
>the Engineering lab.

> This really isn't anybody's business anyway but I feel obligated to
> mention it again to set the record straight.

Well, you've dug into my business....which opens the door to your
business. So tell me and the group just EXACTLY what you DO in the
"Engineering Lab" if it's not shipping & receiving and sweeping up
component clippings. Get down, Candida, what is it you do?

> BTW, there are four others from my work watching all of this here

Yes, there are a half dozen here in my shop who eagerly look for you
all the time. We enjoy you a lot. You make us feel good. We slap
each other on the back, laughing and giggling. One will raise a leg
and blast a nasty ol' fart and holler out, "Yo, Andy Baby, here's a
KISS for ya!". Another will applaud you whenever you "speak". But I
can't repeat what he says about you....not here.

>But, sorry, we don't hire people with criminal records. Don't believe
>me? Phone and ask......

A lot of people have called your employer, so it appears. Anyway,
they hired you. Perhaps they don't know about you?

>> But deal with me direct....not to your sweet ol' goodbuddies........

>What "goodbuddies" ?!?

You know....... your gooooooooooood buddies. (nudge-nudge wink-wink)

>We could talk about how the PLL sythesizer works with the VCO in the
>2004,5,6 scanners from Tandy as outlined in "Cheek 3".

Ok, talk. Unload. Let it all hang out.

>And, once again, YOU threw the first punch and YOU have refused MY truce
>attempts.

Ha ha ha ha ha ha ha.....never a truce attempt from you, Candida.
And, no, I did not throw the first punch. Just the last one.

> You may want to keep that civil suit thing in mind too.

Yes, I have been meditating on the idea.......but my lawyer tells me
it would cost more than you're worth to haul your sorry ass out of
Canada for a trial.

> Especially considering an LA lawyer e-mailed me
>yesterday and said he would just love to work a case of this (unusual)
>nature on a commission basis! 8-)

<gasp><wheeze><croak> No shit? Gimme his name if you don't hire him.
I might.

> And put your hat back on your head that
>pruned-poodle/Krusty-the-clown hair of yours looks ridiculous.

Speaking of which, I really liked the story I heard about your birth
defects and how you have droopy eyelids and extra curly eyelashes, and
how they came about. According to medical records and folks in your
area, you were born without eyelids. Poor fellow. That would be
TOUGH to not be able to blink once in a while.

But you were really lucky to have a plastic surgeon at your birth.
The story continues on how the surgeon had a bright idea after they
circumcised you. Guess the surgeon was wondering what to do about
your lack of eyelids.....and went over to the trash can and salvaged
that foreskin; cut it in half; and GRAFTED a piece onto each of your
eyes. WOW! What a dude!

Then for years, no one really noticed you had no eyelashes until the
guys started calling you "Baldy". Again, lucky for you, that surgeon
was still around and had a few more tricks up his sleeve. Lucky you,
he was able to pluck some of your pubies and graft them into your
eyelids with the result that you look halfway stupid and halfway
mongoloid today. But what a tradeoff, eh? At least you CAN blink.

Don't talk to me about LOOKS, Candida..... If I had a dog that
looked like you, I'd shave his ass and teach 'im to walk backwards.

>> I left you the hell alone as you cut loose with one after another....

>Bullshit! My name came up repeatedly on Fido even though I was not
>posting.

Now you are lying. I put a stop to the mere mention of your name on
FidoNet. YOU were declared off-topic, where it remains to this day.
No.....your name did NOT come up.....not after you got the boot.

> You harrassed my sysop with fear-mongering Netmails.

Again you lie.....out and out lie! You see, Ken Alexander and I are
well acquainted and have been for years. Friends, actually. No
harrassment, Forked Tongue. All I had to do was ask: "Ken, do you
suppose you could tone Andy Moss down a little. The fellow is unable
to control himself." So you were put on a 2-week suspension,
and warned about your behavior.

You no sooner come out of the cooler and start the shit up all over
again, leaving him no choice but to give you the boot with a Size
#13EE crosswise. I affirmed it with an official label of "personna
non grata" and that you were barred from the SCANRADIO echo.

Soooooo, you run off and jump on some other poor unsuspecting SysOp's BBS and start in all over again. I advised that SysOp that you were barred from the echo, but he ignored me. So I advised his Net Coordinator that he (and the net) would risk losing access to the echo if they didn't enforce the ban. Enforce it, they did. End of story, Mossifer. Oh.....there is a little more. Unbeknownst to me at the time, but I learned later that your original SysOp warned you AND Daniel Martin several times before you finally got the boot. Only ONE of those warnings plus the boot order came from me, however the SysOp gave you the boot on his own BEFORE he received my direction.

There's the true story of your adventures in FidoNet and the boot print on the seat of your pants, Mossifer.

>But I do agree that enough is enough - and I'M going away.

Bon voyage.....

>> You had it right the first time....I *AM* moving to a very *bad*
>> part of town. You will be warmly welcomed.....

>Great! I hope your neighbors don't tear the hood ornament off of my
>Oldsmobile, should I drop by.

I'd worry less about the ornament being ripped off and more about where they plant it on your magnificent personage.

>Tell the net why you don't publish your CB newsletter anymore.
>Tell them why you couldn't publish it again even if you wanted too.

It's an OLD story, already published in the opening pages of my first Scanner Modification Handbook. No secrets to it, Mossifer. Shit, I thought you had something great there for a minute. Oh, I could publish it again if I were so disposed. Matter of fact, I still sell the backissues. Once again, your inferences are misleading and like you, fuller of shit than a Christmas Goose.

>The only things that I will respond to from you will be technical items
>that are directly related to the hobby. If comments contain ANYTHING that is
>off-topic or I deem to be inflamatory I will not respond - period!

Cool. Then we'll not be communicating. You certainly have nothing I want; not in the way of knowledge, experience, or money. Soooo, if it's all the same to you, I'll not address you UNLESS, of course, you persist in talking about me.

Shame in a way. After seeing some of the slime that oozed up from the cracks around here, I sort of had a relapse and thought you might be a nice sort of fellow that I merely misunderstood all these months. But after seeing you persist with the lies and innuendo today, I've returned to my senses. You and the ooze are birds of a feather..... peas in a pod..... ants in a urinal.

Don't let the door hit you in the arse on the way out.

Your Maker

:>It clearly states that FAA regulations _allow_ scanners (but NOT
:>transmitters). Most of the airlines state that all electronic devices should
:>not be used during takeoff and landing, but they list a bunch that CAN be
:>used at other times, and scanners are usually among that list.
:>

I flew to Chicago over the holidays and took my scanner on board with me. On the flight to Chicago they said it could not be used during take-off or landing, but could be used at other times. On the return flight they said operation of _any_ radio during the flight was prohibited. Same airline and same route both times.

Since it's been a topic of discussion in the past, I should add that I had no trouble whatsoever taking the scanner on board. No one even questioned me about it.

I opened up this group today with the hope that cheek had been as good as
his word and stopped the whole deranged thing. Alas, there were a half
dozen posts from the perverse-engineer, all of them childish. This leaves
only 2 conclusions. He really does like doing this, and he is a LIAR.
Well, the so called scanner community isnt all that big, and a good many
of them are here. I say let him hoist himself on his own petard. Good
thinking, billie! Alienate your (ex) customer base. Brilliant!
Didnt your poor parents tell you its wrong to lie? Sadly, probably not.....

Bill:
You're absolutely right about the hasty post I made which was done out of utter disgust at the whole situation between you and Moss. I did read all the postings to try to familiarize myself with the group to which I had just subscribed. I am sorry to have implied that the REST of the postings about SCANNERS and related items (isn't that the purpose of this group?) weren't intelligent and worthy of reading. You're also right about the fact that your little squabbles are none of my business. They're nobody else's business either. Why do you propagate your hatered and bad blood here on this forum? This is what I was wondering... I see that it is a touchy subject with you and all the others that read this group. Maybe you should take it somewhere else. You are not king of this group and this is not your court... I retract my statement about unsubscribing from the newsgroup. I do believe that this is a valuable resource for anyone like me that owns and uses a scanner or any other rx device. I will continue to read this newsgroup. I won't let your rantings discourage me. One bad apple is not enough to spoil the fun for the MANY others who are just here to learn and have a good time.

Thanks,
Bob

Helo all....

My scanner finaly went bad and I need to replace it with a new one.
Which ones in the rad-shack line supports cell or can be modified.
Where is the date code, I can't find it on the scanner below
The pro 2037 from what I am told will not work in the cell areas.

Do you know if the 1300 mhz scanner rad-shack puts out will cover the
full range without skipping parts of the 900mhz band.
Not the new model, the older one there unloading for $369.00

Thanks...

> Nice try. WRONG! What you decribe is exactly what you called it, Freqency
> Hopping, not spread spectrum.

I knew people would say I'm wrong, but, freq hopping is now classified as a
Spread Spectrum technique according to the Military, DoD, and Mil
contractors.

Your definition of spread spectrum below is correct and is the definition I
would give if asked what SS is. But these new 900MHz phones advertise SS.
I did some reaserch a few months ago and found that SS is defined as "any
modulation scheme that produces a spectrum for the transmitted signal much
wider than the bandwidth of the information to be trasmitted
independantly of the bandwidth of the information bearing signal". So,
now freq hopping falls into the category of ss. There are now three type
of ss
1. Time Hopping--SS(TH)
2. Freq Hopping--SS(FH) The method 900MHz phones use.
3. Direct Sequence--SS(DS) The method you defined

I was attempting to clear up some confusion people have on what type of
SS these phones use. A lot of people believe they are using Direct Sequence.

Does anyone know the frequencies used by the news stations for:

News4 (NBC)
Eyewitness News (ABC)
Channel 2 News (CBS)
Fox News (FOX)
Channel 9 (UPN)
Channel 11 (WB)

I've heard that anybody with scanners could pick up on what the field reporter(s) are saying to their respective station(s) before it goes on air. I would appreciate any assistance! Thank you.

GR>I am looking for a high end scanner/receiver.
GR>Please drop me a note on what might be available GR>and the
GR>condition, etc.

GR>Mainly looking now at the ICOM R7000 or R7100 as I have
GR>heard lots of good reports. Don't know too much about
GR>the AR3000 still but have heard some good reports.
GR>I might also be interested in the ICOM 100 if one
GR>is available.

Because of new employment obligations, I am no longer using my R7100, so I'm selling it and the other following items for a package price of $1590. I want to point out that this is no ordinary R-7100. The following mods have been performed on this radio.

* The Deltacom computer interface has been internally installed in the radio with a 9-pin serial socket on the rear panel. All you need for computer operation is a serial cable and software (please note that both the Deltacom and ScanStar Commercial software is included).

* 12VDC coaxial input has been added to the rear panel, thus facilitating easier connection in mobile applications.

* Scan/Search speed up. The crystal has been replaced, resulting in greatly improved performance.

ICOM R7100 (unblocked 800 MHz) - Current price is $1688.

Includes original box, all manuals, AC cord, DC cigarette lighter plug.

MB-23 R7100 Carrying handle - Current price is $11

UT-36 R7100 Voice Synthesizer - Current price is $54

Deltacom computer interface - Current price is $349

Registered ScanStar Commercial - Current price is $129

If purchased new this package would cost over $2000. Please E-Mail if interested.

533. Homemade scan antenna attic

Newsgroup: rec.radio.scanner
Date: 1996-01-07 00:00:00 UTC
From: valhalla@infinet.com
Message-ID: <4cm762$dsp@horus.infinet.com>
Source record: 243142

Hello
I just got a 2035 and would like an antenna in the attic.
Would prefer a home made one. If I get a store bought it
would be for an outside mast and I would still want an
inside one for bad weather, etc.
Thanks.

since others addressed your first questions, I'll respond to the last
one...
Yes that might very well be morse code. Some radio systems have a feature
that transmits the station ID at regular interavals in morse code. This
allows the station dispatchers to concentrate on the job of dispatching (
or answering phones) etc... without having to give the station ID's.
Here in Metro Detroit quite often those automated ID's are interrupted by
radio traffic, when the traffic clears the ID starts over again.

Does anyone know the police radar frequencies? The speed cameras
in Australia are apparently from Holland, and use 24gHz.
I have a 24gHz transciever module with modulator input,
is it of any use? (If you know what I mean.)

> What is it about

Oh, it goes a long ways back and doesn't pertain to you anyway.
That's like stepping into a room where someone passed a little gas,
and asking, "What's that smell?"

> and when will it stop.

That's like asking when will that fart go away. Just leave it the
hell alone and don't breathe it, and (1) you won't have to smell it,
and (2) it will go away all by itself.

> Screw it; maybe I'll just unsubscribe from the newsgroup.

Heaven forbid, but if you must....stop by the cashier at the door and
get your money back.

>I hoped there would be intelligent postings here.

I don't suppose you bothered to look at most of the rest of the
articles. No, hell no, that's just too friggin much to wonder. To
find intelligent postings here, one needs to be intelligent in the
first place, and do an intelligent search pattern.

Never mind. It gets complicated from there.....

>Jon Ayscue
>ayscue@stsci.edu

As others replied, the low power handheld talks to a high power big radio in the car (the "vehicular extender") on a special freq. (which is the one you want to scan) , which then repeats it to the dispatch base on the regular freq. This allows the officer to talk to his dispatch with only his low powered handheld. This also works in reverse, as the car radio retransmits the dispatch station to the portable. In California, the Highway Patrol is on low band, and portables wouldn't do much good away from the station.

Scanning the extender freq. will only work for you if:

1: The officer has it turned on.

The motorola version doesn't run unless it's switched on. Officers patrolling or sitting on the side of the road watching for speeders often don't turn it on because they don't need it. When in the car they just use the car radio.

Most only turn it on when they get out of their car. By then they already have somebody and they're fairly harmless to you!

2: You get close.

These are low power radios. I can usually only hear then 1/4 mile away at best with a good receiver.

Endel

560. SPORTCAT Test Modes

Newsgroup: rec.radio.scanner
Date: 1996-01-07 00:00:00 UTC
From: RR <riecks@tds.com>
Message-ID: <4cna50$56d@voyager.ff.tds.com>
Source record: 243169

I have found a few test modes for the SPORTCAT 150... here's
what I discovered... anyone know any others?

WARNING: Using these will reset or erase the frequency
memories on your scanner! Try these at your own risk!

1. Switching the unit on while holding the LockOut, 2 and 9 keys
will result in what appears to be an LCD test mode. The LCD display
will slowly "light-up" all the segments and indicators on the LCD
display. The unit will stay in this mode until you do one of the
other sequences noted below.

2. Holding SCAN-2-9 or <period/dot>-2-9 will load the memories with
what must be test frequencies. The greqs that show-up are:

SCAN-2-9 .-2-9

1 30.0500 30.0000
2 40.8400 40.0000
3 49.9000 50.0000
4 138.1500 140.0000
5 162.4000 155.0000
6 173.2250 170.0000
7 406.8750 410.0000
8 453.2500 460.0000
9 511.9125 510.0000
10 108.5000 54.0000
11 118.8000 109.0000
12 127.1750 118.0000
13 135.5000 127.0000
14 157.8000 135.0000
15 482.3625 810.0000
16 29.0000 860.0000
17 54.0000 950.0000
18 806.0000
19 857.2000
20 911.5000
21 954.9125

all other freqs are set to -zero-!!

Anyone know the significance of these specific frequencies?

3. Holding HOLD-2-9 or <down-arrow>-2-9 while powering-on clears
all memories to -zero-.

If anyone learns or knows of any more interesting test modes or features, please let us know. Right now, I have to go back and re-enter all the frequencies I lost when I tried this!

Hi Mark;

I've been spending quite a bit of time hunting this one down. When WAPD moved to their new building (courtesy of ME and my fellow WA taxpayers) they haven't quite finished a new radio tower. Story is that until the new freqs and tower are straightened out, they are using the Greenfield 800mhz freqs. I spent a lot of time going thru these freqs but really couldn't come up with anything specific.

I called WAPD and asked, and they said it was 860.4625. This is--of course--a trunked frequency, and I don't really understand how that works. At any rate, I saw another post here, so give it a go on those freqs. The remaining Greenfield freqs are:

811, 812, 814, 815, 856, 857, 859, 860 all suffixed .4625.
You'll notice that 860.4625 and 858.4625 switch the trunk about every week and will need to be locked out.

Tom

You obviously have no idea who Bill Cheek is. He has published
several volumes of books on how to modify a wide variety of
scanners. Look in any HAM store in USA and you'll find them.

>__What do you have to add to this newsgroup PjB that is worth my time?

Well tell us dipsh*t, what HAVE you done?

You don't even know who Bill Cheek is. Proof you know NOTHING about
the hobby of scanning.

Pick up a book once in a while PjB, you might learn something.
Or better yet, unsubscribe to this newsgroup. You don't belong here.

567. Flip Phone scanning doesn't work

Newsgroup: rec.radio.scanner
Date: 1996-01-07 00:00:00 UTC
From: gordonm@coho.halcyon.com
Message-ID: <4cp5kq$3mn@news1.halcyon.com>
Source record: 243176

Using the oft published codes for converting a flip phone to a receiver
or scanner I have some questions.

After inserting the contact for the center terminal and powering up
bunches of numbers are shown on the screen every second or so.

No combinations of keys that I tried succeeded in putting the phone into
a scanner mode. e.g.
#
#55
#55#

the numbers are just displayed on the screen with # showing up as C.

Any suggestions from those who have made this work?

Gordon Mitchell, gordonm@halcyon.com (206) 489-0446

Actually there is software and a cable from Message Tracker.. you plug it into your scanner that is tuned to the paging frequency and you watch your screen fly.

it is advertised in all the radio magazines.

>>So how much longer will this go on?

>This will continue as long as we insist on having the last word.

Seriously, "we" consists of a few imbeciles and nincompoops, maybe
even just one now.....this "PjB".

In any event, I TOOK the right, if I didn't possess it inherently, to
address Moss and give him the opportunity to challenge me direct with
all the crap he's spread here for the last year. He jumped in with
more of the same and no substance, and then said he was out of it.
That is fine with me.......and the matter can end as soon as people
want it to end. If they don't want it to end, then it won't.

>I x-changed e-mail with Bill Cheek, we did not agree so I stopped and he
>did not send any more mail to me. This implies that he is a smart person
>and would be able to figure out the simple act of not responding.

I didn't see any pressing need to agree....me with you or you with me.
I came here to address Moss and then to participate in the forum.
That remains my objective.

If some people feel the need to deal with me first, then so be it. I
am here.....operating under my own name......no secrets, no skeletons,
no long-lasting ill will to anyone. But I will deal with anyone who
feels the need to deal. The level of the deal can be at their choice.
I can deal at ALL levels from the sewers to the stars and the galaxies
and all points in between. I am NOT high falutin and I don't put on
"airs" or walk on water or jump into my britches with more than one
leg at a time. I'm just me....bad ass or good guy, depending on the
frame of reference.

It's really simple......

Bill

> Why do you propagate your hatered and bad blood here on
> this forum? This is what I was wondering...

Well, you're new here. So am I, sort of. The other fellow spread his crap for a year here until some people expressed to me the question of was I afraid to meet his challenge in public? So I came. And a half dozen messiahs jumped in, uninvited, unprovoked, to save the newsgroup.

> I see that it is a touchy subject with you and all the others that read
> this group.

Not really. I just don't need "saving" is all. Especially by sanctimonious, holier-than-thou wannabee messiahs.

> Maybe you should take it somewhere else.

Maybe not. I -=WAS=- "somewhere else" for a year, pal. It didn't stop then. Now this is the closest it's been to stopping for a long time, but ...you come in with all this grand advice.... In a word, No, I shouldn't take it somewhere else. In the words of Brigham Young, "This is the place."

> You are not king of this group and this is not your court...

What brings that up? Did you see any claims to that effect? Do I give that impression? My goodness.......I have made it abundantly clear, but if you can't see it.....then what the hell. I really don't care what you see.......or think you see. This virtuality is a stage on which we all are free to be as we wish....and I suppose, to see whatever we want to see, whether or not it is really there.

> I retract my statement about unsubscribing from the newsgroup.

Aw, don't be wishy-washy now.....

> I do
>believe that this is a valuable resource for anyone like me that owns
>and uses a scanner or any other rx device. I will continue to read
>this newsgroup. I won't let your rantings discourage me. One bad
>apple is not enough to spoil the fun for the MANY others who are just
>here to learn and have a good time.

I'm the bad apple, huh? No shit? You are new here and can pass that judgment so quickly? Ok........then I may as well act the role as far as you are concerned......if that's what you want to see. Accordngly,

as free as you are with everything else so far, including your innuendo and carefully considered opinions, do ponder and meditate on your freedom to eat my shorts, too.

>Thanks,

You're mighty welcome.

The CompuScan 2100 was designed to run with a Commodore 64
using an RS-232 port.

It was furnished with the receiver, cables, and software, and
had a 200 channel capacity.

For a complete review, see "CompuScan/2100 Bearcat Scanning
Receiver," by Joe Desposito, in Jan. 1984 Computers & Electronics
magazine.

Hi Bill,

I for one appreciate your presence here. I hope you can help me.

I own MANY protable sacnners. My major gripe with portables is the audio. The pro-60 I just added to my collection distorts easily. I figure its either a lack of wattage or a crappy speaker. My experience with pro sound systems always taught me that greater wattage meant better quality if the speaker could handle it. Even at low volume. I do not know what is the weak link here. Any suggestions would be greatly appreciated.

Thanks , Frank.

I don't think that Bill Cheek's contributions are the issue here, though I suspect from what I have seen that they are substantial. I have not been on this forum long enough to know any of the individuals involved in this flame war. If one was a clone of Adolf Hitler and the other Albert Schwitzer (sp?), I would not know it. It is tiring seeing all of the messages addressed to this feud. I don't have a problem using the delete key for messages that are not of interest to me, but I understand that some users of this newsgroup pay by the message. This must be particularly irritating to them.

That's it, no flames or no finger pointing, just a hope for a reduction in broadcast hostilities.

I'm right! You're wrong! Am not! Are too!

I'm getting sick!

I don't know who's right or wrong. Since I have no ego or personal involvement in these matters, I'd like to try and look at them objectively and put them in perspective.

From my observations comes the inescapable conclusion that some people participating in an assinine discussion actually believe they're doing something important and are acting like adults. Unfortunately, their childish antics wastes our on-line time and attention. And, unlike real life, we can't send them outside or to their rooms until they learn to play well together.

It's clear to me there won't be a winner in any of this because this newsgroup isn't a court where FACT -- not personal opinion, animosity and general BS -- carries the day. The people who think one side is right and the other wrong will likely continue to think the same way regardless of what's posted here.

In my profession, I facilitate strategic planning meetings for groups, both large and small. I've learned that when you begin hearing the same comments a second or third time, it's time to move on. So, take it to email, guys, and send your comments to folks who have concern about your issues!

Reposting Bill Cheek's comments in digest form? Get a life! Peter, would you mind terribly if we send email to your postmaster at postmaster@teleport.com complaining about you reposting Cheek's supposedly "vicious quotes," along with copies of your postings. Seems fair to me,, because you can't have it both ways. When you repost the quotes, you're guilty of the offense you charge him with.

tc

My favorite anti-jam technique (and one I didn't like being used on me was)--Ignore the jamming. It works folks, drives ECM ops nuts, is it working??? Is it not working??

There is a subject line on postings, you know if it's good or not. So quit cluttering up *more* bandwidth by posting "stop jamming" messages.

From: JeffC@gnn.com
Message-ID: <4csed7$abf@news-e2a.gnn.com>
Source record: 243008

I've read some of the "Cheek" and associated B.S. on the newsgroup.

I always allow myself one off post to voice my opinion on the
subject of parasitic people that have the need to speak their mind
at the expense of others.

We live in a great country, and have access to a great system of
computer communication. However, there are manic, grandiose
personalities that insist upon irresponsibly using their free
speech priveledge to annoy organized efforts of others.

I have no idea what this guys's problem is, because I usually don't

spend much time reading garbage off topic posts. I do know that he

like to call his critics "messiahs", while he speaks prophetically
himself. He needs an outlet to relax himself, unfortunately he
hasn't chosen a newsgroup suited to his needs.
Well, as I said, I vented once on the subject, and that is that.
Please, no one extend this thread.

Thanks,
JeffC@gnn.com

>Would the BC9000XLT have AGC.

The Uniden/Bearcat BC9000XLT and Icom R7100 both have AGC (automatic
gain control).

The effect of AGC in the R7100 can be readily seen if
you connect a spectrum analyzer or panadaptor to the 10.7 MHz IF
output jack and watch the amplitude of *all* the signals in the
passband decrease when you tune across any strong signal.

Neither radio has external controls to disable AGC nor to adjust the
attack and decay times.

In the BC9000XLT, transistor Q36 serves as the AGC control
amplifier. You might try defeating the output of Q36 to defeat
the AGC, or add a potentiometer to it's output to create an IF gain
control.

Altering the AGC in the R7100 looks easy, too, and you should
read the R7100 service manual, which contains a good explanation
of how the AGC time constants are changed depending on the mode.

> ...can the modes be manually selected?

Yes, in both models.

I seemed to have gotten attached to the count feature. Press 'count' once and get the total hits for any scanning channel. Hold down 'count' for 2-3 seconds and you will be able to scroll through each bank and look at what channels are programmed, locked out, or niether.

Much better radio than my old RS 2006.

I also have one for sale for $300 plus shipping. It is new, never used, but am waiting for missing pieces(antenna, and adapter).

Frank.
Oregon.

606. Need to stop garbage messages? Stop responding.....

Newsgroup: rec.radio.scanner
Date: 1996-01-08 00:00:00 UTC
From: shustak@parkcomm.iii.net
Message-ID: <4crafp$jmv@news.iii.net>
Source record: 243037

Most hams understand that the best way to stop a repeater jammer, is to ignore the transmissions. Jammers need reinforcement to confirm that they are irritating other users.

I would think that this technique would work with newsgroups.

If someone posts a message that annoys you, try emailing your angry retort to yourself. It will satisfy your need for revenge, will keep message traffic on the group to a minimum, and will prevent the saboteur from gaining any pleasure from his actions.

I prefer to read scanner messages, instead of the latest arguments between various parties. Perhaps if people want to argue, it would be better to send such communication via email.

Chris

607. Re: FL FHP & trunked cable system

Hi all,

Someone mentioned seeing that someone in Fla. had applied for
800MHz frequencies and didn't know who; thought it couldn't be
the Highway Patrol.

I just saw the below message on a local BBS - the KC4MHH BBS
here in Gainesville, Florida. Guess it answers the question.

Todd Sherman/KB4MHH

---------------------------<snip>---------------------------------
Date: 01-01-96 (19:53) Number: 1745 / 1746
To: JESSE RHOADS/KE4CQE Refer#: 1741
From: JIM CARR/KC4MHH (Sysop) Read: NO
Subj: FHP FREQ'S Status: PUBLIC MESSAGE
Conf: MAIN BOARD (0) Read Type: TEXT SCAN (+)

Try these. These are the "official" state assignments:

453.575 R F-1 FHP Troop K Turnpike Dispatch/Aircraft
453.625 R F-2 FHP Troop K Turnpike Dispatch Backup
453.675 R F-3 FHP Troop K Turnpike Patrol/Maint/Service Plazas
453.675 R F-4 FHP Troop K Turnpike Patrol/Maint/Service Plazas
156.180 FHP Troop K Turnpike

Yes, Channels 3 & 4 are the same! Must be different PL's.

154.665 R F-1 FHP Area Dispatch
154.680 R F-2 FHP Area Dispatch
154.695 R F-3 FHP Area Dispatch
154.920 F-4 FHP Emergency/car to car/aircraft
465.1625 Mobile Extenders

FHP Station Channel Assignments for VHF F-1 through F3 Above.
The following stations are assigned F-1 (154.665)

Troop City

1 Crestview
2 Marianna
3 Panama City
5 Tallahassee
15 Jacksonville
16 Ocala
20 Lakeland
21 Pinellas Park
27 Orlando North

34 Ft. Meyers
36 Ft. Pierce
40 Miami North

The following stations are assigned F-2 (154.680)

Troop City

22 Tampa
23 Daytona Beach
24 Deland
25/26 Cocoa
31 Venice
32 Arcadia
33 Lake Placid
37 Pahokee
38 Lantana
39 Ft Lauderdale
41 Maraton
42 Key West

The following stations are assigned F-3 (154.695)

Troop City

4 Pensacola
6 East Point
7 Quincy
8 Madison
9 Perry
10 Cross City
11 Gainesville
12 Inglis
13 Lake City
14 Starke
17 Palatka
18 St Augustine
27 Orlando South
29 Kissimmee
30 Bradenton
37 Pahokee
40 Miami South

Input freq for 154.665 is 155.505
Input freq for 154.680 is 155.445
Input Freq for 154.695 is 155.460

PL Tones:

Statewide (154.920) 186.2
Gainesville 162.2
Lake City 186.2
Ocala 233.6

I have all the PL's, but only listed the local ones. If you want all of them, let me know and I will list them.

FHP has been licenced for the new 800 MHz system, but the system is not yet complete. These are the fancy new towers that have been installed on the interstate. This is a trunking system and consists of the following frequencies.

851.6125, 852.2625, 853.3875, 853.8375, 853.8625, 853.8875, 853.9125, 853.9375, 853.9625, 853.9875, 854.0125, 854.0375, 854.0625, 854.0875, 854.1125, 854.1375, 854.1625, 854.1875, 854.2125, 854.2375, 854.2625, 854.2875, 854.3125.

Let me know if you need more..... Jim

> control. The computer interface is fragile at best. I installed a
> couple of sub-mini jacks on the lower left front case for computer
> control using the CX-12. It was tedious and works well. The downside
> is that these arent sealed type jacks and the chassis breathes. But for
> indoor use it works great.
> 4. A metal chassis would be nice. The stock chassis is pretty flimsy.
>
> Ralph Adamson
> VAFB, CA

...I would also add:

1. Ability to define how many channels in each bank, not static at 50.
Let the user choose from a pool of 1000 channels, allocate them
wherever they want between the 20 banks.

2. Black knobs for squelch/volume/selector, with white line on the
side of each, so you can see the knob's position. Gray knobs with
a little gray dot on top are just too tough to see (on my radio, I
put white silicone seal carefully between two of the knurls in
the squelch and vol knobs. Looks nice and I dont have to look
at the tops of the knobs to see where they are positioned.

3. Faster scan/seek. The advertised 30 ch./sec is a crock. You can
get 30 ch./sec if you set the PLL lock to 0 and the squelch lock
to 0, but the radio will be essentially deaf (but it will scan fast!)

4. Backlit LCD rather than edge lit.

5. Better contrast on the LCD when held at an angle (characters fade
from view unless you hold it head-on).

6. Longer battery life, or, have 6 AA's instead of 4. Nicads only
last about 4-5 hours. Sucks if you're out all day.

7. Make radio lose power gracefully, rather than the rather rude
garbled audio when the batteries get weak. The radio REALLY
could use a battery-life meter, tied to the s-meter bar graph

display (or maybe a simple voltage check button sequence that
shows current batt volt in the LCD display)

8. Fix the bug that resets the radio if you load a passed channel
into the VFO.

9. Scan delay should ALSO be settable for each channel, not just
for the whole radio. Same for each search bank.

10. For the Canadian, British, and US markets, get rid of the
Kanji characters in the alphanumeric tag character set. Use
the memory for something else.

11. Allow more characters for the alphanumeric tag. There is
room on the LCD for it!

12. I find BandScope useless. Instead, make it work for adjacent
scan bank channels rather than adjacent frequencies.

13. Revamp the recharging circuit. It is possible to overcharge and
really heat up the batteries. Also, if you plug in the charger
or the 12v car adapter, and there is no power to either the
charger or 12v adapter, the scanner will apparently short internally
(or drain heavily) from the batteries. To see the drain, go in
a dark room. With fresh batts in the scanner, turn it on, then
turn on the green backlight, turn down the squelch so you hear
audio (or tune in a radio station). Then, plug in either the
recharger or the 12v adapter WITHOUTH THEM BEING PLUGGED INTO
A POWER SOURCE on the other end, and you will see the green
backlight really go dim, and the audio will start to howl as if the
batteries were really going dead. This is kinda sucky.

14. At least make digits 0-9, A-J, and a-j accessible for direct entry
in the alphanumeric tag when creating one. To create tags for
new channels you really find yourself twisting that little knob
a lot to get to the character you want. Also make it so that
toggling the red Aa button while entering text will make the currently
displayed character toggle between UC and LC.

15. Variable IF bandwidth, or at least a selection of filters to
choose from. Have is set up like the frequency spacing selection.

16. Have a FUNC button on the front panel of the scanner as well.

17. Have a SCAN and M.R. button on the side too.

18. The moni button has to be squeezed too hard. I find myself
just turning down the squelch instead. Needs to be a real button
(but still on the side) rather than a rubber pad to press.

19. I never use the password. Replace that feature with something
else (like variable bandwidth?) on the keypad.

20. Need an "INSERT" function, in addition to COPY and MOVE. This
way you can insert a scan channel between two, and they will
all move down by one notch to accomodate it. Also make a
shifted delete, i.e., when you delete a channel you have the OPTION
of having the channels below it move up by one notch to close
the gap left by the delete channel.

21. Optional bank sort by ascending or descending frequency. In other
words, if you have a jumble of frequencies in a bank, you tell the
AR8000 that you want them ordered by frequency from lowest to highest
or highest to lowest. It IS a fact that a random jumble of frequencies
entered into the AR8000 will scan faster if they are in order from
lowest to highest or highest to lowest. This is because the VFO
does not have to jump all over the place as the radio scans from
channel to channel. If you are a pizza delivery guy you want to
drop off your pizzas at the homes using the shortest distance,
rather than delivering them to the houses in the order they were
called in.

22. Optional bank sorting lexigraphically by alphanumeric tag. I.e.,
sort the channels in a bank alphabetically based on the tag
it currently has. Same idea as #21.

23. Ads for AR8000 say "dual VFO". This is not true. It is ONE
VFO, with the capability of switching between two frequencies.
Would be nice to have TWO simultaneous VFO's (but that would
probably really drive the price up). Split the audio between
speaker and headphone, or have stereo headphone capability. Or,
just have both audio out of one speaker. Do it like the dualband
amateur radio HT's do it.

24. Heirarchical priority channels. Right now, you have 1 priority
channel. Would be nice to have let's say THREE, in descending order
of importance. Say your police is on priority 1, fire is on priority
2, and LifeFlight is on priority 3. Whenever LifeFlight talks, you
will hear it, UNLESS fire comes on the air, in which case you will
hear it instead, UNLESS, police comes on the air, in which case you
will hear it ahead of fire and LifeFlight. Gives you the capability
to listen to more than one important frequency and to not necessarily
have it being currently scanned, just on priority standby.

25. Channel pointers. I have many banks that contain some of the same
frequencies. For example, my local, state, fire, police, and aircraft
banks ALL have the LifeFlight frequency. Why burn 5 memory channels
for one frequency? Each scan bank should let you link as part of
it's scan schedule to a frequency in any other bank WITHOUT having
to explicity copy it into that bank as one more channel. Anyone
who programs in 'C' will get my drift here.

26. I like the bank linking, but I don't like having to do FUNC SCAN
and select the banks I want linked, and have to do same to turn
the feature on/off. Rather, there should be a LINK button. You
press LINK, then the bank you want toggled on/off (or the red Aa

to pick between A-J and a-j banks, then the bank you want). Keep
the bank linking the way it is, but add a LINK button (or bump
the password button and put it there).

I can't believe I am doing all this complaining, since the AR8000 really
is a terrific radio. Just human nature I guess.

Mike

>away at best with a good receiver.

Well, I can take issue with this. Take Missouri for example. Their
Highway Patrol extenders retransmit the dispatch on 154.905 and I was
picking this freq up (Yes, with HP traffic) at distance of about three miles.

Having owned more scanners in the last 18 years than I care to admit I
must say I like the Beartracker BCT-7. If you travel from state to state
then it is pretty nice to be able to just select the state code and away
you go. I think the extender detector works pretty well..... but I don't
think my expectations were very high:-o

On the other hand it would not be the scanner I would pick if it was the
only one I could have. When you are in your home area you will find
freqs it may not have programed and you will have many that you will want
to lockout. It would be a much better scanner if it had more private
banks for putting in your own sets of freqs.

: >If anyone has experience here, I would appreciate some advice.
: >Thanks,
: >Jeff C.

: I have no experience with the AEA device. You might want to check out
: JVFAX 7.0 at the AMSAT ftp site. It is also at the oakland ftp site
: I think) It is a shareware(no minimum fee-kind of freeware).
: You would have to build a simple(single op amp, 3 resistors and a
: capaictor mounted on either aDB9 or DB25 connector that will mate
: to you comm/aysnc/serial port). The software is world class.
: You will need a stable sw radio regardless of what type WEFAX converter
: you use. I use a Kenwood R2000 and it works great. I have an older
: Panasonic RF2200 that is a great voice mode sw, but is just to
: unstalbe for any image/data reception.
: Good luck and viewing.

I too use the JVFAX 7.0 software and have built both the simple
741 op-amp decoder and the slightly more sophisticated one described
in the documents that come with the JVFAX program. Allthough a
better receiver produces better images, I've had very good results
with a cheap receiver (Realistic DX 440 / Sangean ATS 83).

The one problem I suffered was interference caused by the
computer. The solution for me was to use two audio transformers
back-to-back. (Radio Shack sells 8ohm to 1000ohm miniature
transformers for a couple of bucks). You connect the audio
output to the 8ohm side, tie the 1000ohm sides together, and
the other 8ohm to the fax demodulator.

Happy faxing!

Paul

I use the banks in my scanner to represent different towns. When I'm
working in the Prov area, I find that there is a lot of action all
total, when you consider all of the surrounding towns. Also, you
should be able to get Boston Police from there and that's non-stop!

>supposed to work? I've also been looking through Beyond Police Call,

Yes. Its the repeater ID, in Morse. If you can copy code, it makes
it much easier to identify what you're listening to.

>(who would previously listened with scanners) digital decryption radios when
>an emergency strikes? This could be taken as "protecting one's turf" by public
>employees eager for overtime, or recognition as volunteers are more excluded
>from significant contribution by this handicap.

This is not an issue. In non-encrypted service areas, the local hams
use ham radios and frequencies to communicate inter-service (i.e.
police to fire, etc.) This method of operation is SOP, regardless of
whether or not the primary service is encrypted. In no case is a ham
given a police radio and asked to communicate directly on the police
system, any more than a police officer being given a ham radio to use.
Us hams have never had a communications handicap, (except within our
own ranks!) rather, our communications abilites have been demonstrated
to be superior to most city services (as is should be). It would be
up to the authorities in charge to contact the local hams for further
assistance in case of emergency, which information would not be
readily known, due to encryption.

>>I speculate that "Keith" was just venting. I do imagine that he, like so
>>many other dedicated Radio Amateurs, will rise to the occasion when
>>needed.

I'm afraid that he sounded like he was serious to me. Just what we
all need - another newbee ham who doesn't get it.

>Let's all hope so. But some will lose interest in the hobby as a whole,
>with more exclusions and rules, and that could be a loss to us also.

There most likely won't be a ham radio hobby as we know it more much
longer, now that the FCC is going away.

>>Ham Club: Nope, becuase you're cops are encrypted!

>I think it's a wonderful idea. I'll bet that after the first emergency,
>that encryption would come off of the signals REAL quickly!

No Drew, the ham bands would be turned back into commercial
frequencies once we start acting like children (as if some don't
already). If the local authorities can't depend upon the hams for
public service (a charter of the institition of ham radio), then we
shouldn't be holding onto them. After all, the ham bands represent a
huge chunk of prime bandwidth.

There won't be ham radio or scanner hobbies much longer folks.

It is in fact, a big problem. We're not talking about someone
stalking around your yard, looking for a way to break in. Someone who
is trying to pick up a kidnapping victim, or staking out a store has
an advantage by using a scanner to hear what the control dispatcher is
having investigated.

My experience >with pro sound systems always taught me that greater wattage meant >better quality if the speaker could handle it. Even at low volume. I >do not know what is the weak link here. Any suggestions would be >greatly appreciated.

Good question and good subject here. First we have to identify the weakest link, if possible, because it could be one of several. Try connecting a half-decent external speaker to the headphone jack, and then experiment with volume settings. Are the symptoms the same as when the internal speaker is used? If so, then the internal speaker is adequate. If not, then....??? See, space comes at a premium in handheld scanners. It is not likely the internal speaker can be replaced with something better, so you may be forced to continue with an external speaker of some sort.

If symptoms are the same with internal or external speakers, then the problem lies in the design of the scanner's Audio Power Amplifier, and it is probable that you'll have to "live" with it. Power is synonymous with battery drain. Mfgrs like to claim long battery life, so the audio side is compromised to achieve that spec.

There are some things that can be tried, but more power is not a goal here; rather, to clean up what is already there. To that end, there is usually a shunt capactor of a value of 0.001-uF to 0.01-uF hung on the input of the audio power amplifier. Removing this capacitor, or replacing it with one of 1/2, 1/3, or even 1/10 value, always has the effect of raising the treble response of the amplifier. This is usually good since voice intelligence is contained in the upper half of a typical receiver's audio bandpass of 300 Hz - 3000 Hz. Emphasis of the upper end gives a greater clarity to the output for the same power levels.

Some people with very good hearing feel this mod produces sound that is too "tinny". For me and many others, it is almost a panacea. Worth a try....and if you don't like it, then the capacitor can always

be reinstalled.

There are some differing techniques for "tweaking" the design of the audio power chip, but the chips vary from one to the next and each requires different techniques that may or may not be good. We better let this go for the time being until you've tried the above.

If an external speaker sounds good, you could build up a small portable speaker that might not be too obtrusive. Radio Shack's 40-242, 40-243, 40-245, and 40-246 might be good starting points.

Let me know what you come up with.

Rgds,

Bill

I doubt very seriously that the legions of hams here in the U.S. would simply turn their radios off and throw them away if the bands were taken away and converted to commercial use. I know I wouldn't.

Actually FAR 91.21 prohibits the use of ANY portable electronic device
including receivers. There are specific exceptions for things like
hearing aids and pacemakers. Also excepted from the restriction is any
device that the airline (aka the certificate holder) has determined will
not cause interference. The pilot in command may make determinations on
his/her own but should not violate the airline's policy.

Bill,

Thanks for the detailed response. As it is I bought the Pro-60 and sold the Pro-62 beacuse of 'hissy' and 'tinny' audio. So If I did the treble mod I would probably be right back where I started. So.....

I hooked up some cheap but decent headphones (RS Nova 56) with a mono adapter and it sounds great. I also tried the RS clip on spekaer but the distortion was sill there, but not in the headphones as the level required is obviously much lower.

I understand that the Bearcat 3000 portable has very good sound but also suffers from one of mt pet peeves which is an anoying squelch tail. The GRE radios seem to excel in this area. I did do the squelch tail mod on my bearcat made RS Pro-51. That along with decent audio makes it a keeper for me.

Thanks for the info,

Frank.

641. Michael Alexander Strikes Again

Newsgroup: rec.radio.scanner
Date: 1996-01-08 00:00:00 UTC

This is getting so crazy that I can hardly believe it and I
apologize to all of you with the explicit exception if M.A.
I thought you just might want to know what a total jerk
this Michael Alexander twit is just in case any of you were
considering wasting any further time or money listening to
his ranting here or in any other media. I include here, in
it's entirety, a message I just received from him. Sounds
kinda threatening wouldn't you say. Scares me bad! HAH!

-
-
-I've been thinking Marky baby and I just gotta tell you: Not long ago, I
-wrote a book about computer security (just hit the stores, in fact) and in
-it I caution employers that giving their employees Internet accounts opens
-them (the company) up to all sort of interesting and previously unimagined
-liabilities. I mention, for example, that employees are going to be induced
-to post inflammatory and derogatory messages on newsgroups, which could
-result in legal action. I go on to say that those messages will orginate
-with the company's address as well as often include a signature with the
-employee's name, rank and serial number, so to speak. Imagine, I say to Mr.
-or Ms. Employer, you could be held liable, even sued for these sorts of
-messages. The only way to protect yourself against that is to have a
-written policy that prohibits this sort of behavior--that policy, I add,
-should include a statement about the negative consequences of using the
-company's Internet access, it's info systems and its good name improperly.
-
-I've also kicked around the computer industry quite a bit and I know many
-people, including some of the PR folk at AMD. What do you think their
-reaction might be if I happen to inquire about AMD's policy regarding posts
-by employees? Might make for an interesting conversation--heck, perhaps
-even fodder for my next book on I-way security.
-
-This is all bald-face speculation, of course. Nothing you said was libelous
-(stupid, but not legally incorrect). Still, I think it would be a nice
-gesture if you posted an apology in the newsgroup for your ill advised
-endorsement of that clown's Copeland's remarks. Whattya think? A nice,
-gracious apology for sticking your nose into something that you did not
-intend to?

Who appointed you the USENET spokeperson? Everyone? If we were to say that Mr. Cheek misused the newsgroup how does he also misuse the net? My ire isn't raised. How did you arrive at everyone's ire being raised?

>Just as he apparently did on FIDO.

Apparently?? You don't know yet you would make a statement like that? Impressive! Uh...sure.

>By the way, anyone seen any posts from Moss lately?

Not I. I don't understand why either. He did post quite often on here and made some bold statements about Mr. Cheek. I for one couldn't wait for confrontation and clearing of the air. Instead it is a repeat of the pissing and moaning of the past. The difference is the sides have changed at half time. Hell, all you have to do is repost all the flames directed toward Moss when he was ragging on Cheek. Just change swap the name Bill Cheek for Andy Moss and Andy for Bill.

>Me either. He is not getting involved in this.

As I recall Andy said he would be more than happy to meet Bill on here. I was disappointed when Bill didn't show. Now I am disappointed when Andy doesn't show.

>Isnt that what you wanted, Mr. Cheek?

Knowing Bill as I do, I really doubt it.

>Why is Cheek persisting? Hmmmm?

Why are you?? I see Cheek laughing at you. I don't consider it persisting. I see you posting all sorts of BS like 'send mail to his ISP' because he so terrible, then your daily digest and now all this crap. It seems you post more than Bill does on the subject. You are a joke.

BTW, I don't mind if you continue in your present lost way on this NG. I don't have to read what I don't care to. You don't either.

SK>.............. Much more important is the ability to
SK>manage frequencies; this can best be done either with computer control or
SK>multiple scanners. But that's *here*, for *me*. So, for me, a setup of
SK>several scanners, with one computer-controlled, works great, and is part
SK>of what I use to decide what to buy next. For someone else, in for example
SK>a small town, one scanner may handle everything. But there, speed of scan
SK>would be more important, with the ability to scan at least as many
SK>frequencies as are being used. More than one scanner might not be of any
SK>use in that situation, and computer control may not be anywhere as
SK>important.....

Hi Bill.
I agree with you about multiple scanners being better in highly active areas. One 200 channel scanner can only receive one frequency at a time. Several 10 to 50 channel scanners can monitor multiple frequencies. I lean toward programming them more by subject (ham/police/fire/medical) but that is personal preferance. And those frequencies of maximum interest can get programmed into more than one scanner. I'd try using the larger scanners for the lowest activity services and smaller scanners for more active services. The 200 channel scanner is nice where you want to have everything programmed but don't scan all banks at one time. None of my equipment is new enough to have computer control but I can see it as a major improvement for maintaining a useful frequency list. Just wanted to add my two cents.

Hi,

I seem to recall OKI cellular phones have some unusual key sequence that effectively turns them into a scanner. Someone I know just bought one of their models (sorry, I don't know which one offhand). Naturally I'd remind him not to try this in any countries where this sort of fun and games was forbidden by law but I was wondering if somebody out there knew the correct sequence.

Thanks in advance,
-Patrick Penzias Dirks.

Well, he's certainly got my vote!
I'm hoping these morons Andy Moss, PjB, and Micheal Alexander
will crawl back under whatever rock they hatched under until
they're through molting or whatever it is that seems to be
giving them such fits.

Hoping the S/N ratio gets back to normal soon, Mark

652. Cheek's Rec-Scanner Technology Forum

Newsgroup: rec.radio.scanner
Date: 1996-01-08 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <4cpo4b$4nk@news2.cts.com>
Source record: 243118

Greetings to all who enter here. Do not abandon hope. Grab some of it and propel your own star; ride your own wave; pursue your own impossible dream. And, never forget that failures are only...and THE only steppingstones to success.

This thread is where I will be pleased to address any technical subject relative to scanners, scanning, and re-engineering. I will not reply to flames, provocative gestures, and other idiotic articles posted here. I hope others will not do so, either, but that is a matter of consience and choice. My choices are stated.

If you have a grievance with me, or merely want to take a pot shot or two for "effect", then try me in Cheek's Rec-Bitch, Whine & Flame Forum where I may be pleased to accommodate specialized needs, time and inclination permitting.

I will address issues of pertinence to scanners here. I may not get around to reading all the other threads in this newsgroup, so if you need a reply from me, this is the best place to post the article or question.

My time and resources are very limited, and I am not pleased with the efficiency of all the newsgroup readers/editors that I've tried. This thread will enable me to be johnny-on-the-spot for any and all who need technical assistance without having to wade through the riff-raff and ooze that otherwise irritates some people.

I will do my best to keep this thread non-irritating and non-confrontational.

I will NOT do business in this or any other public forum, so please use e-mail or other appropriate media for business matters.

I hope this special thread is useful to you and that I can be of a service with no strings attached.

Bill

653. Cheek's Rec-Bitch, Whine & Flame Forum

Newsgroup: rec.radio.scanner
Date: 1996-01-08 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <4cpo4f$4nk@news2.cts.com>
Source record: 243119

Greetings Dissenters, Snivelers, Whiners, Bitchers, Howlers, Imbeciles, Nincompoops, Idiots, Malcontents, Jerks, Lids, Twits, BrainDeads, Control Freaks, Sanctimonious Holy Ones, Messiahs, Preachers, Smart Fellers, Fart Smellers, Smart Asses, and the Mentally Disturbed.

Greetings also to those who may have a legitimate gripe about something connected with me, my personage, my breath, my looks, my dress, my genetics, my soul, etc.

I will do my best to deal with non-topical matters here that seem to chap some people's hides when treated in other threads on this forum. By having two special forums in this newsgroup, one for topical matters and one for non-topical, maybe this will please those who feel deprived or depraved over their powerlessness to control Life around them.

I will do my best to call a spade a spade here and in Cheek's Rec-Scanner Technology Forum. I may or may not have the time and inclination to visit and reply in other threads. So if you really have a beef with me, this is the place to air it. I may or may not give it any credibility or substance, depending on HOW you come on to me. If you are decent, I can be decent. If you can want me to do something, I can want you to do something. Two-way streets are the rule in my books, so don't shoot unless you're willing to be shot at.

I will be active and present in the two threads mentioned. If you address me in other threads, I may not know of it. If you want a piece of me, here is the place to go for the gusto. If you want a piece of scanner technology, then be decent and try me in the other thread. I really can't promise to be available elsewhere in this newsgroup, but I'll do my best to be here. And in the Cheek's Rec-Scanner Technology Forum. Depending on your needs, of course.

Fair enough? Anyone have a problem with that? Who's going to fire the opening salvo?

Bill Cheek

654. Cheek's Rec-Open Letter #2

Newsgroup: rec.radio.scanner
Date: 1996-01-08 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <4cpo4k$4nk@news2.cts.com>
Source record: 243120

Greetings Good Guys and Bad Guys (and, in-between guys.)

Ok, here's a new deal. Andy Moss slunk around here for months, flaming and castigating me without much interference. I let it go until some folks asked me if I was afraid to come out on the newsgroups to meet his challenges.

Hell no! I ain't afraid of much of anything in conventional ways. I deal with my fears by facing them and oftentimes, plunging in headfirst. I *watched* you guys LET Moss have his way with me all these months, so I figured it would be all right for me to jump in and have a go at 'im myself.

Well, that sure brought a handful of brain-dead and mentally disturbed oozing up from the cracks. The big ol' snit and stew that subsequently evolved is history. And now....maybe it's over. Moss posted an article saying he was not going to respond anymore. I can live with that. The question is......can others? We'll see.......

Meanwhile, I found out WHO some of my friends and enemies are. I needed to know that anyway.....same as you need to know that sort of thing for yourselves. Now that I know......I'm perfectly willing let things settle back to a dull roar and to get on with the leisure pursuit of scanners and scanning. A LOT depends on WHO else wants that, too.

However, I am going to stay here. Permanently. And I am not going to go out of my way to aggravate anyone like a handful have tried with me. Today, I posted two distinctly different threads to which I will make a point of reading and replying DAILY. I may NOT have the time to read other threads, and/or to post to them, but I will read and reply to the following two threads:

Cheek's Alt-Scanner Technology Forum
Cheek's Alt-Bitch, Whine & Flame Forum

The first is for those who want to discuss with me or ask questions about any aspect of scanners, scanning, scanner technology and re-engineering, and otherwise to deal with me in a civil, decent manner. The second is for those who want to continue grinding an axe. The first is topical; the second is not.

I will probably read and reply EXCLUSIVELY on those two threads for a while. This should take the wind out of the sails of the snivelers, whiners, and messiahs who feel their rights are deprived by my posting in other threads. Surely, as my reasoning goes, no one can gnash his teeth over two measly threads with my name on 'em to make it

EASY to skip over if desired. And for those few who STILL don't like it, well.....I guess they can pack sand. You can't please all the people all the time, so I won't waste my effort trying. But I will read and reply on the above two threads for those who need or want me in any manner.

This should help get the newsgroup back on an even keel. If not, well, shit! (I tried.) Is everybody happy now? Weren't we before?

Bill

655. CP2100 - HELP!!! PLEASE??

Newsgroup: rec.radio.scanner
Date: 1996-01-08 00:00:00 UTC
From: 75627, 2516@compuserve.com
Message-ID: <4cpuds$k1q@dub-news-svc-5.compuserve.com>
Source record: 243121

All,

I have inherited a Bearcat CP2100. This is a Bearcat scanner that connects to a PC, and using a product called the ACE Scanner Control System you can control the scanner and record freq. that have hits, the time, etc.

The problem is: I do not know the input voltage from the (apparent) DC connector on it (barrel plug) and if it is TIP + or BARREL +. Also, there is a series of 8 DIP switches on the bottom that I'm sure do something??

There is no info. on the WEB, and most places I call have no idea what this scanner is.

If you do, please help.

Thanks

>Memory batteries will last a lot longer that way.

>Rgds,

>Bill

<snip>

The context in which I felt this was a design flaw was based on the previous discussion regarding internal heat. Yes, having it on all the time keeps the memory alive (although they could have designed it with non-volatile memory), but so does leaving the external DC power supply on all of the time (as you pointed out).

Using the external supply just eliminates the biggest source of heat inside the box. I personally don't find lower life expectancy "no cost", or desirable. It was simply cheaper for the manufacturer to build it that way, and it met his basic criteria. I simply meant to suggest that there are BETTER (and slighly more expensive) ways to meet all of these requirements.

My comment regarding using a REGULATED DC power supply stems from the fact that for every volt OVER that necessary for the scanner's internal regulators to reach and hold regulation, more internal heat will be generated. While probably not near as great a heat source as the internal (and marginally spec'd) AC transformer (which can also be a source of a healthy 60Hz field), voltage drop across regulators is also a major contributor to internal heat build-up.

A few have brief lists. When I go to a new base I'll usually stop by a Radio Shack close to base and they're usually pretty cool, I explain I'm from out of town and don't want *all* of the freqs for the area just a few. Most have a modest list and certainly not all. I gave the local RS a list and my WWW list and they said they'd give it out and use it. Most manager know Police Call is a good deal and people will buy it, I get it almost every year it's a great ref. My suggestion is if you go to a RS and they don't have any lists, go to another if poss.

You & he remind me of all the 'white trash' adults that I used to hear arguing/threatening/posturing over the CB all day & night back when I was 15 years old. You guys have a symbiotic relationship, and I'm happy that it at least keeps you off the streets, but I think that if you stop & think about it for a while, you might realize how silly you end up looking by taking the time & effort to bicker like this.

I really think you have better things to spend time & energy on, but maybe I'm wrong. I've often wondered whether the same couple of CB'ers who felt obligated to spend hours on the radio arguing & acting stupid each night back in the early 1980s are still at it too...

Tim

As I have just told Mark Montgomery by telephone, I am quite serious about contacting his employer.

Of the 7-8 posts that I have made here in the past 4-5 weeks (about 8 in all), only one was a attack on Bill Cheek and in response to something he posted. Bill posted another message, which I sent to him privately, which was also derogatory. Since then, I stated publicly that I would refrain from personal attacks on him and I have done so. I made one comment to a message related to Bill, which was obviously intended as a joke. He remarked that he found it funny.

Even so, I have been singled out by two individuals in this forum who claim to be supportors of Bill's. One is this fellow Copeland who has repeatedly resorted to name calling in every one of several messages in support of Bill.

Montegomery, whom I've never said anything (let alone anything unkind) to, has taken upon himself to lend his support to Copeland in his bid to make me out the bad guy. I don't believe that I should lie down and let this happen.

These gentlemen feel that by insulating themselves behind keyboards they can say whatever they want with impunity. I am merely pointing out otherwise. The fact that Montgomery chose to post a private message here suggests that he wishes to continue this argument publicly rather than putting it to rest, which I advocate (forcefully, I admit).

Mr. Morrisseau, I believe that you and I have had a difference of opinion, several months ago. I don't recall the specifics, but I suspect your vile characterization of me is in part founded on that. Would you mind telling me where YOU work?

Oh, your description of me is wrong. I DON'T have long hair.

That's ok if you think that. As long as you don't mind being real
wrong..... I do fire back at those asswipes who launch missiles
first, and miss. The secret here is to either make the first shot
count, or ..... don't shoot in the first place. Is THAT cosmic
principle so difficult to understand? It must be for some.....

>Relax dude it's gonna be Okay.

I know. But it won't be ok by accident or decree. Takes a little
effort, don't you see? Sometimes you just have to find out what
people are made out of first..... Many are made out of flesh &
blood, but some are made of shit and it's hard to tell through the
veneer..... Time most always tells, though.

Relax your own self and enjoy the show. It's only virtual.....

I think you're both right, just not on the same wavelength. Radio frequencies are worth money, and if we don't generate enough money (which we can't under our existing rules) to afford the
purchase of some congressmen of our own, we won't be able to compete with cellular and other
businesses who are hungry for spectrum.

I also think they'll have a tough time getting 500,000 hams off the air. That's why the CB bands are lost forever - you can't put the genie back in the bottle.

no real problem on ANY of the airlines I travel with scanner all the time.
SCanners will not interfere with avionics. Have taken it with me many
times in a 210 and used it as a secondary receiver! In a 210 the scanner
is right next to the avionics vs in a large jet it's much farther away!

Or else he/she is an AOL employee.

In any case, this kind of crap is why an address of @aol.com is
generally ignored or even unwelcome in some circles.

Hmmm...It must have been someone using the same address and service as
you who just before Christmas posted adverts for the scanner interface
at a "special" price (twice) !

You know, it really is your "fat-head" attitude that turns people off.
I don't condone the 2-way BS that has been going on for years now
here and on the FIDONET between you and Andy Moss but he was right
in his latest post...you have an obnoxious and abrasive way of dealing
with confrontation...I noted this years ago. Maybe this is why I do
much more reading than spewing off at the keyboard.
I won't lower myself to respond to your childish limericks.
(You're like a big kid...can you say RESPONSIBILITY ? :)

It is however quite noticeable that this newsgroup was nice and
quiet (in a responsible sense) before you showed up...too bad you
couldn't stick to the FIDO Scanradio conference...or is it
the "Bill Cheek Scanner Mods Book support area" ?
Now is that conflict of interest or what...Bill Cheek...the man who
turns a profit from marketing scanner mods, moderating a non-commercial
Bulletin Board Network conference dealing with scanners !
(Oh ya...no commercial hooks over there, right ?)

I always meant to ask...did YOU design and write the code
for the scanner interface that you sell ? Thats the 2-way unit that
taps feedback from the LCD display right !? :) (Kludge)

>manager if he found out I was giving that list away!"
>I haven't been back to that store since.

I have previously made my feelings known about any of Radio Shack's dealings, but something VERY similar to this recently occured with me.

Police Call is an OK book, but it is basically just licensing information. In my area, the listings may be accurate with regard to licensing, but they are way off with regard to use (and have been for a few years). My solution...I put together my own little booklet of CONFIRMED frequencies. My booklet contained inputs, outputs, PL tones, channel IDs, channel usage, callsigns, etc... It was very detailed. After printing a few copies on the laser printer, I scurried off to the local Radio Shack to offer some to them. The store manager said what I had put together "was illegal" as it "violated the copyright of Police Call". He told me of previous legal proceedings that he had been part of with regard to a similar situation. He further stated that he would be forwarding the details of this incident to his boss for possible legal action.

After laughing in his face and pointing out a few bits of law, I decided all was lost and simply left. I will never shop in that store again. It was clear he had no clue what he was talking about.

Before everyone jumps in and says they have never had a problem at their local RS, I submit that not ALL Radio Shack stores are this way. I only speak from experience. Your mileage may vary!

I was looking at a Pro60 for 224.00 seems like a pretty good buy. But can it be modified for the 800 bands. Also anything else about this particular scanner that would make me buy it instead of something else.

Just for the record, our buddy and once-respected scanner tinkerer Bill Cheek has got it under his craw that_ I _am the revered BullCheek. Ha! He has sent me several hilarious threats by email to the effect that he coaxed AOL into giving me up to him! HAHAHAHA! Well, for the record, I am _not_BullCheek (although I admire him) and eagerly await cheeks legal onslaught. Maybe I'll post some of his threats to me. Anyone interested?

What good is the password anyway? It can eaisly be reset by anyone.
The way the password reset feature SHOULD work, is that when resetting
the password, the freqs in the protected banks are deleted.

There is alot of confusion going on about the cordless frequencies.
Obviously the North American frequencies are 46-49 MHz
and Australian is in the 30MHz range. Both are right depending on where
you live.

>As an alternative to radar detectors, I'm interested in a Bearcat
>scanner that features receipt of police "mobil extenders". Can anyone
>tell me what mobil extenders are and how they work?

Last I heard, they were the low-power repeaters that broadcast the
car radio to a handheld nearby. F'rinstance, my locals use 37.100Mhz
for base-to-car and 453.8375 for car-to-handheld, thereby extending
the car radio a short distance (100 meters).

Having the mobile extender freq in your car scanner enables you to
hear traffic as well as a cruiser radio hears it.

Scanner-specific database programs are a real rip-off if you have to pay any money out. Free....well, I can't say too much. But who works for free? Not you. Not me. Soooooo whaddyado? There are a bunch of scanner freq databases out....but believe me, you don't want to mess with 'em.

How about Microsoft WORKS for Windows? v3.0 for Windows 3.x and v4.0 for Windows 95. WORKS consists of three powerful modules and several applets. The modules are a word processor, a spreadsheet, and a database manager. All three are very good and many small businesses use WORKS for their main productivity package.

The price? Under $50 in most places and under $80 with MS Bookshelf 95 thrown in. Now get this.....I use MS WORD 7.0 for my word processor; MS EXCEL 7.0 for my spreadsheet; and MS ACCESS 7.0 for my database manager..... BUT.....I still use WORKS' spreadsheet and database manager for things that need a quick and dirty handling. If I were forced to, I could go back to them full time and manage.

The WORKS database module is what would interest you right off. It is a flat-file database manager, easily configurable for just about any moderate need, (32,000 records) from scanner frequencies to home and business records, to you-name-it. One powerful aspect of the WORKS database manager is its ability to IMPORT and EXPORT a variety of different file formats. It also has an extremely easy to use and setup QUERY function. Let's face it, WORKS is one magnasty tool for the radioist, period. You can zip from one module to the next; swap files from one to the next....that is, pop a spreadsheet into the database or word processor or vice versa......piece of cake.

Specialized scanner frquency database managers cost $25 and up, and are good for only one thing.....frequency records, and even then, most do not allow a flexible Import/Export function. For under $50, you get The Force, and I didn't even tell you about the applets that come with WORKS.

Oh, and most anywhere you buy WORKS will have a money-back policy if you don't like it. Whaddya got to lose, dude? Microsoft WORKS for Windows could well have been designed with the compleat radioist in

mind.

Rgds,

Bill

John D. Trolinger of jdt@vivanet.com concocted himself up a beautiful "Snitch Report" and sent it to my Postmaster thusly:

>To: postmaster@cts.com
> Can't we kick this guy off of here. I have been away from this news group
> the past year, and to see this still going on means I will end up leaving
> it again. Thank you for this consideration

> e-mail comments left by Bill Cheek on alt.radio.scanner as follows:
>1/2/95:

And then Trolinger has the medicine balls to quote our dear Peter (PjB) Breath's ignorant "CHEEK DIGEST" reposts to my Postmaster. I bet my postmaster is still laughing his ass off..... :-)

Mr. Trolinger is an old acquaintence of mine dating back a number of years. His "snitch report" and "nastygram" took me quite by surprise, especially when he accused me of starting trouble here a year ago. I guess I should give him the benefit of the doubt and ASSume he has Alzheimer's or Senile Dementia except that I've written him two e-mails now wondering what tripped his trigger and smoked his tail feathers. No reply.

Next question is why did Mr. Trolinger LIE by inferring that I have been here all year causing trouble? Even the basic, casual low-life knows I've been on here but a couple of weeks now. Backstabbing is one thing. Lying is another. Nice work, Mr. Trolinger.

What a snitch! And for what? If Mister Trolinger has great things to contribute to the forum, let him have at it and I'll not interfere. Otherwise, why does he interfere with me and what does he hope to gain?

No clue. Sad. So very sad.

Bill

I've only seen pictures of the 2004, but here's a thought......How
about using that extra space for LEDs or Switches for mods?

Gary Mumma gmumma@erols.com

728. RADAR JAMMER

Newsgroup: rec.radio.scanner

DOES ANYONE KNOW WHETHER RADAR JAMMERS ACTUALLY WORK? THERE SEEM TO BE TWO EXPENSIVE UNITS (THE PHANTOM AND THE INTERCEPTOR) BUT I DON'T WANT TO BLOW $600 WITHOUT THERE BEING A CHANCE THAT THEY ARE MORE THAN A BOX WITH AN LED ON IT.
ANY SUGGESTIONS/HELP/ADVICE WOULD BE GRATEFULLY RECEIVED.

IAN

[Article crossposted from tor.forsale]
[Author was Steve St. Denis]
[Posted on Sun, 7 Jan 1996 23:02:37 GMT]

ONTARIO SCANNER FREQUENCIES:

I have a list of all the Scanner Frequencies in the Province of
Ontario, in this list also are Frequencies
for Buffalo N.Y. and Western N.Y.. The List is over 800,000 bytes
long. I have put this list into a small
computer program and also included the 900 codes and 10 codes for the
Niagara Regional Police.
This program will work in Windows or DOS, You don't have to run this
program to see the list of
Ontario Scanner Frequencies, the list is in text form and you can run
it in your own Word Processor if
you like.The program that you receive has a Search feature in it that
will search for a Frequency or a
Word, Also it has Auto-Scroll, you can auto-scroll through the list by
holding down the right mouse
button, or by pressing the number keys on your key board 1 through 9,
the higher the number the
faster it will scroll through the list. You can also page up and down
through the list.

The Program comes on a 3-1/2 INCH 720-K disk that will self ex-tract
into its own directory or into
any directory on your hard drive you wish.
You can run it from Windows or Dos, it will make it's own icon and
place it into the Windows Screen
for you. Price: $15.00 dollars

Also have Scanner frequencies for many Cities and States in the
U.S.A.. and Canada Tell me what
State or City in the U.S.A. Or Canada you want and depending how large
the list is will dictate how
much I charge you . If the list that you want is not to large I can if
you want send it buy E-.Mail to you
in either one part or several parts. If the list is to big to split up
I can send it through the mail to you on
a computer disk or Computer print out.

No PST, GST, OR Shipping Charges
If interested please E-Mail me.
Steve at:

sstdenis@iaw.on.ca

Fort Erie Ont. Canada....

From: EDNUNEZ@news.delphi.com
Message-ID: <4cv134$2h6@news2.delphi.com>
Source record: 242979

I have a 3 year old AOR AR-1000XLT hand held scanner for sale or trade. This radio is in like new condition, with 2 vynil cases, AOR rubber duck and RS telescoping antennae, 120V wall adapter and 12V car power cord, 4 AA NiCD baterries and manual. The radio has 1000 channels in 10 banks of 100, freq. lockout in search, 10 search ranges, user programmable search steps (5.0KHz to 995.0KHz), AM/NFM/WFM modes, .5MHz to 1300MHz coverage (uncut), linkable search banks, priority channel scan, and delay on/off (2 sec. universal delay, applies to all or no channels), display light, and freq. lockout in scan. The radio is about the size of a Uniden Bearcat BC-100/200XLT.
I will consider trading this radio for a RS PRO-2006 in very good to excellent condition, with only the diode mods (cellular and speed mods by cutting the diodes behind the key pad), or a BC-2500/3000XLT handheld. Other radios will be considered if of equal value. I will also sell the radio for $300.00 firm, with 2nd day UPS Blue shipping included in price. Drop me a line if interested here or at edon@tnb.com

741. Help: Yupiteru MVT-7100 Memory Resets !!

Newsgroup: rec.radio.scanner
Date: 1996-01-09 00:00:00 UTC
From: jshidler@iamerica.net
Message-ID: <jshidler.11.0176347E@iamerica.net>
Source record: 242980

I am having an extremely annoying problem with my Yupiteru
MVT-7100. It seems that the batteries are loose in the battery compartment
and when they shift around all of my remories are reset, wiped clean!!!
Needless to say this is very annoying and I am about to blow my brains out!

I thought that I had the problem solved by inserting a small piece
of foam rubber between the batteries and the battery cover. This seemed to
work, at least it kept the batteries still yet this afternoon the same thing
happened again. This time I had replaced the batteries with re-chargeables
and they ar a little smaller in length than the alkalines that I had been
using and there was a little bit of lateral movement. AND low and behold, the
darn thing reset again.

I have tried bending out the connecting pins in the radio but
they inevitably go back into there pre-bent position and also I am afraid that
I am going to break them.

I am also at a loss as to why this battery movement resets the
memory because the memories are not affected when the batteries are changed
and they do not have to be changed in any order or any 2 left in the the radio
or any thing like that,.

Please any help on this would be greatly appreciated.

Hi, I was wondering if anybody knows the length I will need to make
the cross pieces on a Yagi antenna to pick up 143-144Mhz
I live in Victoria BC (Actually Colwood- A suburb) and I want to pick
up Vancouver BC Police. Do you think a Yagi antenna would work good or
is there some kind of better antenna.
Also if anybody has any frequencies for the Victoria BC or Port
Angeles, Wa area that you have found or know (not from the Bc
Frequency list - I own it) could you please send them to me, I might
be starting up my own page with Scanner stuff on it for the Victoria
BC area,
Thanx,
Cory

747. Computer Interface for pro 2006

Newsgroup: rec.radio.scanner
Date: 1996-01-09 00:00:00 UTC
From: jamee@ic.net
Message-ID: <4csl0c$h7s@condor.ic.net>
Source record: 243014

I have just purchased a pro 2006 scanner and want to get a
computer interface for it. I understand my choices are limited, and want
the interface that will fit my needs (wants).
My main use will be to search and log frequencies while I am away
at work. I would like to be able to sort the resulting hits and use the
info to program the scanner when I have the time to listen.
What would fit me best? I am aware of the Opto-456 and the CE-232
but I really don't know which would be better. I have never seen an
in-depth comparison of the two.
Any help would be greatly appreciated.
Thanks,
Jon Meeks

Subject: Re: Vote here in Favor of Bill Cheek
From: jococour@cdsnet.net (Mr. Ed)

I have never read any of Mr. Cheek's books, nor have I applied any mods
to my scanner, however, I believe that without him discovering and
disseminating his mods, the scanner world would be an infinitely lesser
community. The speed mods, memory mods, restoration mods, etc., all of
these mods were first discovered by Mr. Cheek, and his attitude of "let's
see what I can make this scanner REALLY do!" has changed the attitudes of
the community to where the consumer expects a good deal more control over
his scanner. Also, his no-bs evaluations have helped me out tremendously.
So often in radio publications, the authors are forced to be somewhat
sycophantic in regards to reviewing their advertiser's scanners...hence,
reviews sometimes seem to be a little sugar-coated. Well, with Bill, you
get his straight unvarnished opinions. True, they're sometimes harsh,
sometimes profane, but so was give-'em-hell-Harry! In short, I vote a
solid YES to Bill Cheek's value to this NG, and to the scanning community
at large

Mr Ed

>provide less of a signal loss?

There are several. For starters, your scanner probably
has a 75 ohm input. RG 58 is 50 ohm feedline. RG 59
has about the same price and size, but would provide
a better impedance match. RG 6 is a lower loss 75 ohm
alternative.

What are you trying to hear? An omnidirectional
indoor antenna is not a high sensitivity setup.

Perhaps YOU don't need "saving" but your reputation sure does! I spent a lot of time on RIME and FIDO and your reputation was, IMO, quite good. Your posts were well received and the information useful. You came across as a professional.

IMO your performance here has not even come up to the standards of "unprofessional." It has more of the flavor of a bar brawl between inebriated bums. That's sad.

Instead of maintaining a professional demeanor you chose to descend further into the muck than your "opponent." I shall not soon forget this and your reputation in MY eyes is forever tarnished. Since you defend your actions and demeanor I gather you don't care what others think. More's the pity.

Did all you scanner-users read that? BOLLOCKS I say!

There is a program around which uses the audio-out of your scanner, and an
easy to build interface to your PC, you can read messages all day.
If you (or anyone) needs it, I'll post it here. Just ask.

Thanks for the detailed info... I had this test mode written down somewhere, but misplaced it quite a while back.

Maybe you'll have better luck than I at figuring out what this stuff is, but you know about the L/O-WX combo to give you a batter check??

Well, pressing some of the buttons gives you numbers that are in the same format as the battery check indicator.. but I have no idea what they do.

Pushing buttons 1-8 I think it was, give you numbers... 0 I think it was returns you back to the battery level reading... and I think it was SCAN that did something odd.

Any luck with this stuff, lemme know... I'm interested in exploiting my SC150 for everything that it's got.

Thanks

1 meter for the reflector and director elements.
50 cm each side for the driven element.
This of course is roughly how you would build a transmitting antenna, and
will work well on the receiving end.

The impedance match isn't important. I'd go with RG6 for a run that long.
It's cheap and it works.

David

Dave,
Police Call lists a frequency for flight-for-life here in Milwaukee,
WI. However, I've never heard anything on that frequency. I have,
however, heard FFL on my local "firecom" or "mutual aid" channel on
several occasions. My brother reports having heard them on one of the
med unit <-> hospital frequencies....

Good luck!

>qualifying telecommunications only. What is the reason for this?

It all has to do with the ECPA law forbidding the sale of new scanning
receivers capable of receiving cellular telephone frequencies.

Like other scanners which existed before the cellular ban and are still
sold, there are two versions in existence: the original, and the current
"consumer" model which has been castrated. In the case of the R-1, the
"government" version has continuous coverage, and the consumer version has
a gap between 800-900 MHz.

That being said - the R1 is a radio whose main attraction is small size,
and its performance is a series of design compromises nmecessary to
achieve that.

>I realize with the Universal m-1200 you can recieve GOLAY and POCSAG digital pager modes
>but what good is that if you can not control which one you are recieving.

>What is some name of good software that can sort pages by numbers and such?
There is a shareware product that can run on a PC. It is called
pd-102.exe Have a look for it and if you can find it I may be able to
post a copy to you. It interfaces to the baseband audio from the
receiver and not via an M-1200 or other decoding gadget. It then
converts the bit and blip pattern to text on the screen. I beleive
that you can select the pager number.
>Also what would I use to convert Data Cell calls (Fax/ASCll) from my pro-2006 to my PC?
> I believe I have to connect to my recievers detector.
>Is this hard to do??
With the above software comes a schemantic to build a Schmidt trigger
to attempt to restore the low freq component that is lost at the audio
output. I dont really know what ou mean by a "Data Cell" call. The
average fax sent over a cell phone will be V.27 or V.29ter and will
not be decodable by any software on the PC that I know of. You will
probably need a fax modem to do a good job. For the ascii the same
story applies you probably need a modem. On VHF there are also a lot
of proprity encoding schemes. You either roll your own or spend the
money to buy the one off commercial product.

Some of this type of monitoring may be ilegal in some areas (but is
probABLY OK in Canada.

From: RR <riecks@tds.com>
Message-ID: <4d16r1$2pq@voyager.ff.tds.com>
Source record: 242797

Has anyone had any experience with the DSP Noise Filters available out there from companies like MFJ and JPS?

Are they useful for cutting-out static and similar background noise from the audio? I am an idiot right now as far as DSP technology goes, so I'm just searching for information.

SP>I have a list of frequencies for the Las Vegas and Southern Nevada
SP>Area. If anyone is interested in the list let me know.

I was just in Las Vegas for CES and found the scanning interesting. I used a list provided by Radio Shack, but wouldn't mind having a better list.

What did I hear? Some woman called 911 because she had the clapp (sp)! I heard a good failure to yield that ended up in a car chase near the airport, at times crossing the runway. A PD car was lost in the chase due to loosing an oil pan while driving off road. The perps (who drove a stolen car) bailed at the Luxor. Two got caught and two just blended in with the crowd. Luxor security was notified to guard the exits. [Would of been nice to have that freq!]

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired.
It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners.

About a year ago when I was going through one of the local BBSs, I found a .dbf file (about 10M) of business frequencies just for the state of Indiana. There were two other files for Illinois and Michigan. They were in a format similar to POLICE CALL, but also had some fields that police call didn't.

The only thing I have found on the net so far have been sites to buy such lists.

Can anyone point me in the direction of where to find more files such as this?

_Mark

>jococour@cdsnet.net

Not hardly! With all due respect to the Mr. Cheek and the scanning community much of his information is based on Mr. Parnass's work at Bell Labs. You'll see things in Bill Cheeks books that look real familiar to Bill Parness's work with due credit to him...this leads me to believe that Mr. Cheek is purely in this for his own interests...it's easy to copy and compile. Much of the information in his compilations can be easily found on the internet and are authored by individual certainly not credited in Bill's books.

Obviously he like to prolong the controvery here on the groups becasue it more publicity for him. Here's a though to ponder...do you think it's actually him logging on as an alias?

Let's get back to group theme and forget this fool.

Who the Fuck cares about the Publications!!!

Man are your idiots missing a few screws.

What Is Bill a God or something? Give me
a fucking brake.

So he has a book out. wippieeeeee Big deal. Its not hard to
do the same kiddies! Becides does that make someone right?

Two seperate issues here guys WAKE UP!

rec.radio.scanner
and
some book

(mods that if you can figure out yourself how to do with
a service manuel then it offers some help)

Whats this Vote CRAP?? More fuel??

As for the Three people taking issue with Bill, better think
again. Not everyone is as stupied as the rest of you and has to
always add his two cents worth. Somethimes it better to say
nothing then to say anything.

As for Andy and Bill They are both trouble makers.

They are acting like children. He said she said. Both want the
last word. Personally I beleave Andy has started the whole thing He
sure has with me in the past. So I'm talking with experience. But It

takes a bigger person to end it. Andy has. Bill continues. So who's better?? None they both are looking for attention and know how to get it.

You kids are just adding fuel to their little flame.

Bills Book if you find it useful is a seperate issue from this newsgroup. Remember that. You talk about how one contributes to this newsgroup then look at the content of their messages not what they are selling.

Wake up Kids Think about what you say before you say it!

g_reed@icon.net (Glenn Reed) wrote:

> It is tiring seeing all of the messages addressed to this feud.

I take it you think that feeling is legit. Ok. I can handle that.
Now can you (anyone) handle some of the things I am tired of?
There's the rub. One person (not especially you) tires of something
and expects the right to quell it with a command or a plea. Others,
like me so far, simply don't express what we're tired of. When the
tables are turned, however, it's suddenly a different story.

> I don't have a problem using the delete key for messages that are not of
>interest to me,

Right on! Me, too. Or not download those messages in the first
place. Which resolves the hypothetical problem you raise next.

>but I understand that some users of this newsgroup pay by the
>message. This must be particularly irritating to them.

Whooaaa......(1) they are getting ripped off, if that is the case.
What are the bona-fide situations where newsgroups are available only
by the message meter? WHO would tolerate such a thing? Do they not
have alternatives? And if not, then (2) Some newsgroup reader/editors
allow picking and choosing off-line those messages to be downloaded.
The problem you raise here is not one that should merit condescending
by the rest of the crowd. Horses are not allowed on the freeways, and
in many states, neither are bicycles, pedestrians, and underpowered
vehicles (motorscooters).

> That's it, no flames or no finger pointing, just a hope for a reduction in
> broadcast hostilities.

That's cool. But the cessation MUST begin by those who initiate it,
no? I mean.......HOW can the recipients of this bullshit reduce it?
Could the 6-million victims of Hitler's holocaust have reduced the
number of deaths by.......being more placid and peaceful? Ri---ght.

The best possible solution, methinks IMHO, is for those who START it
to STOP it. Well, it is verrrrrry interesting how three of the
biggest perpetrators and continuers of this bullshit are Peter (PjB)
Breath, Michael Alexander, and Andy Moss, though Moss appears to have
ceased and desisted now....and he WAS the ONLY aggressor at one time,
not two weeks ago. HE stirred the shit; he fanned the flames; he kept
it smoldering and buring for a year. And now he's made a graceful
exit leaving Peter (PjB) Breath and Michael Alexander to continue his

dirty work.

Far better you express your hope THESE TWO stop and then see what happens if, and when they do. I have taken steps to start doing my part, but so long as they keep it up, you can't expect me or anyone else to "let it go". No. They will stop. And my resolve on this is carved in basalt and granite.....vote or no vote.....one against a million or a million against one. The record and the facts speak for themselves. Neither Breath nor Alexander had ANY call or provocation to jump in, much less continue these hostilities.

Please address your comments and hopes to THEM where the bullseye stands out like a sore thumb. Shooting from the hip into the dark cannot hit home. "Home" is where I told you, but don't take my word for it. Check the record. Ask around.

Thanks.

Bill Cheek

michael@alexander.terranet.com (Michael Alexander) wrote:

> what have I said or done that you find objectionable? Cite an
> instance or two,

The objection is how YOU took a flying leap of faith, unprovoked and unneeded, and landed into a whole world of shit. And then had the medicine balls to cry foul and pretend innocence. You had no call to zero in on me when I showed up for Andy Moss. I went for HIM; not you. I didn't know YOU from Waltzing Mathilda at the time.

And then to make matters worse, you're STILL involved in something that never pertained to you; never involved you; and never provoked you. You've done painted yourself into a corner....and instead of seeing where you went wrong, you're STILL lashing out.

Mr. Alexander, you were and remain categorically OUT OF ORDER.
That, sir, is the objection. Like it or lump it, that's the record.

Excuse me? Beg your pardon? You get down and state EXACTLY what you
think is Mr. Parnass' work. Better still, you get HIM to confront me
here, if HE thinks I plagiarized his work. You understand me? I'm
getting "virtually" pissed at this crap, first initiated by Moss and
then you. I don't plagiarize, period. I had never heard of Mr.
Parnass during the course of my first two books, and there is nothing
in the 3rd to even resemble his work. But not in the first two,
either. Why don't you let Mr. Parnass vocalize this shit if he thinks
it. You certainly are in no position to speak for HIM or me. And if
Mr. Parnass published anything at all that resembles what's in my
books, it is possible that he got the ideas or the procedures from ME.

You never looked at it that way, now did you?

> You'll see things in Bill Cheeks books that look real familiar to Bill Parness's work

Like what? What "things"? Put up or shut up. Don't pop off your
mouth unless you can back it up. Spit it out. Task me with your
specific accusations right here. I will address each one. Otherwise,
the diarrhea of your mouth is dribbling down your shirt from that hole
in your lip.

>with due credit to him...this leads me to believe that Mr. Cheek is purely in
>this for his own interests...it's easy to copy and compile. Much of the
>information in his compilations can be easily found on the internet and are
>authored by individual certainly not credited in Bill's books.

If these mods are on the Internet, then they were plagiarized from my
books. I know the source and history of every item in my books, and
either credit was rendered to the source, or I did the development and
research! Without exception. If you bothered to READ, you'd see this
to be the case. So put up or shup up. dingleberry!

>Obviously he like to prolong the controvery here on the groups becasue it more
>publicity for him. Here's a though to ponder...do you think it's actually him
>logging on as an alias? Let's get back to group theme and forget this fool.

Go ahead. That's your business. But when you dabble in libelous
statements, you and me are going to do a little rockin' of the boat,
and I hope you can swim.

Now let's set the record straight about Mr. Parnass. There was ONE instance where I may have published something of his. It was in a column for Monitoring Times a couple or three years back...where a reader sent me a "procedure" for VLF tuning an ICOM R-71. I published it in my column. A few months later, Parnass told Monitoring Times the procedure was his. As far as I am concerned, it's hearsay and unsubstantiated, but we apologized and that was that.

Since then, I have been reluctant to accept ANY outside input for further publication, because I have neither the time nor the resources to track down every little tidbit of information that comes my way.

However, you or Mr. Parnass should get down and dirty with what you've just shit out of your mouth above, because this is one area I am NOT going to take sitting down. Moss started it; you're keeping it going; so ask me specific questions and let's get this resolved. NOW.

Either should be OK. Actually, there would be nothing wrong with hams
using 10 codes...it simply would not be "HAM PC"...but it is more
correct for hams to use voice "10 codes" than to vocalize the
telegraphy Q codes (just IMHO). But in saying that, I used to live in
Miami and believe it or not, Metro Dade (Miami) was using "Q" codes,
not 10-codes.

I disagree. Verbal shorthand and proper procedures are useful in
voise radio communications, and using telegraphy abbreviations is very
approriate for amateurs, especially for international communcations,
even with other native English speakers. It's a common base of
understandable phrases, and most phrases spoken by someone with a
strong Glaswegian accent (for example) are difficult enough to
understand.

It's too bad this thread has such an objectionable subject heading for what is an otherwise interesting discussion.

It would seem that protocol on the phone bands has evolved in a somewhat less than systematic way. It varies from region to region, and from band to band, probably due in part to groups or individuals who reside on a particular frequency, and feel the need to key up and criticize every time someone says something a little different.

It would make more sense to start practicing a more universal phone protocol. It doesn't make a whole lot of sense to have to use different terms whenever you change bands. Granted, calling CQ on a 2 meter repeater seems unnecessary, but it shouldn't be considered an egregious offense on the calling frequency.

One purpose of the Amateur Service is to provide a pool of trained operators. Why not train them in proper HF phone protocol while they are still on the VHF frequencies? Most folks learn by listening. They do what they hear others doing. Each operator also seems to have a little of his own personal style. This is a good thing I think.

What's appropriate on 20 meter USB should not be considered inappropriate on VHF. A little greater tolerance by some would also be nice. Probably the most inappropriate kind of protocol is to key up a say something like "we don't say 'over' on this here repeater". People will learn by example, and rudeness is not a particularly desirable quality to teach to new amateur operators.

Hi: I'm curious as to why both of you offered your freq compilations to
your local Radio Shack in the first place. Were these to be for sale or
were you guided by a sense of public spiritedness? I ask that because I'm
not surprised by the managers' reaction, which would seem normal under the
circumstances reasoning about copyright violation etc. was faulty, but I
could see how they would think that it was unusual that someone would want
to offer them what amounts to free merchandise to pass out. And I think
that wanting to sell PC is a valid point of view. I'm not saying you or
the managers did anything wrong--I just don't understand what transpired.

> Does anyone have instructions to mod a Pro-51 to restore cellular?

Cellular restoration in the pro-51 is easy provided that your scanner has not been sent back to be reconditioned while on the shelves of Radio Shack. Some say you can tell if yours have been fixed by the date code (3 digit number on the back under the belt clip) but I have found this to be unreliable.

To modify your pro-51 turn off the scanner. Turn it back on while holding down the "band" key and the 2, 9 keys. (all your programmed frequencies will be erased by this procedure) This sends the scanner into a start-up mode while its doing this hold down the "lockout" and 2, 9 keys all together. A frequency will appear. Type in "manual" "23" if when you do this your scanner reads 888.9600mhz then your unit has not been reconditioned and you can listen to the full 868-896 cellular band by using the up down arrows. If this modification works I recommend that you program the low frequency 868.9500mhz into monitor memory and from there program it into regular memory allowing you to easily search this band do the same with the high end freq 896.1mhz by doing this you can use the up/down arrows to search very easily through this band.

Good luck my three digit code read 12A3 and it works fine I have a friend whose code is 7A4 and it works too. If yours does not work and you want this band return your scanner and get another one but prior to purchasing preform the above procedure in the store to see if it has the band and you can't go wrong.

>from personal attacks on him

Not to me, you didn't. And you haven't stopped yet. Your cute little
e-mail campaign is another sidetrip we haven't fully explored yet.
You are one backstabbing, backbiting, patooty-kissing sonofagun, I'll
give you that much.

>Even so, I have been singled out by two individuals in this forum who
>claim to be supportors of Bill's.

Supporters, shamorters. Bullshit. No one is running for public
office, notably yours truly. It's a wholly different picture than
that type of thing. There may be some politics, all right, but this
supporter shit ain't exactly accurate. I am no better than and no
worse than the next man. I have no more power than nor any less than
the next man. In a word, though, there is a mindset....perhaps two
mindsets. One, the vociferous minority seemingly echoed by you has it
that it's OK to initiate an attack on someone, but NOT ok to retaliate
or defend against it.

Another mindset for which I am willing to take the HEAT as one of its
spokesmen is very simple:

1) If you can't stand the heat, get out of the kitchen.
2) If you can't take it, don't dish it out.
3) Do not initiate attacks on people.
4) If you do initiate attacks on people, then don't look down on
them when they respond in kind....or even differently.

That's "my platform", if it is to be vocalized, Mister Alexander. And
YOU opened the door initially.....aggressively.....on the prod...
clearly and venomously against me. I had done nothing but go after
Andy Moss, the reasons for which are legend and history. I had an
inherent right to do so. You had no inherent rights in coming after
me other than the simple choice of being the aggressor. Sure, you had

THAT right and you exercised it.

Well, Mister Alexander, I am one to live and let live. I don't bother people in real life nor in virtual life any more than absolutely necessary to maintain an existence. I take no more from society than I give it in return. I lead a nice, quiet, uneventful life oftentimes. Apparently this conveys a false impression to certain people who interpret this as a wimp-milquetoast characteristic. I wish it were possible to lug around a great big sign that warns of swift, decisive retaliation to those who tresspass.....

You made a serious error in judgment, Mister Alexander, and thus far, you persist in perpetuating it, heaping error on top of error. I wish you could only stand there and face matters for a moment with an open mind so that you can SEE that I am here for the count. And SEE where others of a similar mindset are also dug in. And then SEE where you can't possibly win. The ONLY viable choice you have is to unceremoniously let it drop and take a draw. That's right, a draw!

Neither I nor anyone else I know of with this mindset is interested in "winning". We're simply not going to lose. It is resolute and scribed into the Rock of Ages. TAKE the draw, Mister Alexander. It is the only viable and honorable choice available to you. Take it.

Bill

No, Mr. Duff. It may have been someone else; not me. Post the damned
"evidence" or crawl back into your hole and plop down on your duff.

>You know, it really is your "fat-head" attitude that turns people off.

What makes you think I try to turn people "on"? I live and let live
until assholes come jumping and stomping into my Life where they have
no business. You don't want my "fat-head" attitude? Then butt out,
fella. But if you want to come in peeing and shitting all over the
place, that's fine. Just expect to get peed and shit at, too. And I
don't miss. It's a two way street, and the choice is always yours.

>I don't condone the 2-way BS that has been going on for years now
>here and on the FIDONET between you and Andy Moss but he was right
>in his latest post...you have an obnoxious and abrasive way of dealing
>with confrontation...I noted this years ago.

Whether or not you condone anything is between you, your concience and
maybe your mammy. But you sure won't get any obnoxious and abrasive
returns out of me so long as I don't get them from you first. You are
just downright stupidly in error on me advertising here. But you made
the accusation. Now I am telling you where to put it. If you don't
like that, then why did you make the FALSE accusation in the first
place? Don't shoot, Mister Duff, if you don't like being shot at!

The Andy Moss matter is dead now. Give it a rest. Or are you
thinking of stepping up in his place? If so, I heartily encourage you
to give it your very best shot right off. Make sure it hits and sends
me reeling. If you miss....or if I get back up, I will be all over
you like stink on shit. You understand? You have to make your next
shot count..... It is vital.

>It is however quite noticeable that this newsgroup was nice and
>quiet (in a responsible sense) before you showed up...

Was it now? You speak with forked tongue, Mister Duff. Maybe you ought to go to church and sit on your duff and beg forgiveness for lying through the gaps between your teeth? I watched the newsgroups for a year, fella. Don't tell me how "clean" they were........

> too bad you couldn't stick to the FIDO Scanradio conference...or is it
>the "Bill Cheek Scanner Mods Book support area" ?
>Now is that conflict of interest or what...Bill Cheek...the man who
>turns a profit from marketing scanner mods, moderating a non-commercial
>Bulletin Board Network conference dealing with scanners !
>(Oh ya...no commercial hooks over there, right ?)

And what issue is that of yours? I posted a message to the effect that you are FREE to start your own echo. So go do it! You talk a line of shit a mile wide. So ACT! Get off your duff and do it. You're not a helpless nincompoop, are you?

Ummmmm, by the way......you are stepping well out of bounds on this issue, Mr. Duff. I'd NOT persist, if I were you. You are on "borrowed" time, as it is. Take the draw while you can. Give it a rest. If you persist with the idea of "winning", you will lose. Take the draw.

>I always meant to ask...did YOU design and write the code
>for the scanner interface that you sell ?

As a matter of fact, it was a joint effort between a programmer and myself. He knew nothing about scanners and I knew little of coding. It was a dual, joint effort. Why do you ask? I'm sure you're not really interested at face value.

> Thats the 2-way unit that taps feedback from the LCD display
> right !? :) (Kludge)

The CE-232 Scanner/Computer Interface reads the serial data flow from the scanner's CPU to the LCD Display Driver, yes.

Kludge? What do you mean by that? The only other place to read it is at the PLL. It's the same data in either place: SCK, CS, CD, and SI. What's the difference? A data stream is a data stream, and there is no other way.

Take the draw, Mr. Duff.

Oh, don't get me wrong, EXCEL is a mother of a spreadsheet all right. I use it, too. It can even serve as a small database handler, too. Very powerful. The thing is, Excel costs some bucks, and can be more complex than appreciated by the casual radioist. For those who can use it, more power to them. EXCEL is baaaaaaaad!

But Microsoft WORKS is a standalone package of the things most needed by the small business and not-too-complex hobbyist. A fine word processor, spreadhseet, and database manager plus some other nifty little applications, all for under $50, makes it a powerhouse for the radio shoppe and monitoring post. Also, WORKS is a logical path to later uses for MS WORD, ACCESS, and EXCEL. I still use WORKS a lot in my daily affairs. It's unique and easy to use...with some neat power.

I have been looking a the Service manual for the AR8K to detemine
if its possible to use the SSB 4.0 KHz filter while in the AM mode.
It looks like it could be done but would require some cuts of the
circuit board and a switch. I am aware of the AR8000DX filter mod
but that uses the connector for the DS8000 and I don't want to give up
that feature.

bcheek@cts.com (Bill Cheek) wrote:

> I really do believe in Freedom of Speech
>and Freedom of the Press.

Bill,
I appreciate that. I do too. That's why this note is coming from my personal Internet account. That's right, I pay for a PPP account even though there are two computers (a PC and a VAXstation) on my desk at work that have ethernet connections to "the internet".

However, I would like to point out that many, many people out on the nets are there on someone else's nickle... their school, their job, their public library, whatever. Many, heck, I'll ventrue most, of these people, are affected by net censorship. The people paying the bills can't afford the bandwidth to receive every message from every newsgroup so they have to pick and choose which groups to carry. They can't afford the disk space to save messages from every newsgroup so they have to severely limit retention time or pick and choose which groups to carry.

When deciding what groups to carry, a business usually looks at several things:
- what's directly relavent to the business
- what's indirectly relavent to the business
- what's relavent to various technologies the business uses
- what's requested by employees
- what won't be found offensive (ugh)

Now I know I don't have to tell you any of this. You're a smart guy, as are most of the people here, but, I'd like this to serve as a reminder that if we clutter this (supposedly) fairly technical group with stuff that has nothing to do with RF scanners and stuff that is potentially offensive, we're setting ourselves up to be dropped by anyone that has to pick and choose what to carry.

I'd submit that there's nothing in the letters between you and Moss (and, hell, the letters from everyone that complains about them or supports them) that would make me want to carry this group if I were a system/network administrator looking for newsgroups to trim to conserve bandwidth and DASD.

I'm not trying to pass any kind of judgement, but I'd like to remind you of a few phrases that I'm sure you've heard before... "Divide and conquer" and "United we stand, divided we fall". Can scannists, a group that is fighting increasing regulatory punishment and other

attempts to deny our pursuit of our hobby, afford to be fighting among ourselves? I have to repeatedly ask the same question of some acquaintences who ride (mostly) Harleys when they give me a hard time for choosing to ride a Goldwing or choosing to wear a helmet or choosing to equip my motorcycle with mufflers that actually muffle exhaust noise.

OOTC: This morning, while pulling into work (Pewaukee WI, about 20 miles west of lake Michigan and Milwaukee) I heard several rescue calls from a northern-Chicago suburb... easily 70 miles southeast of me. I rarely pick up transmissions from that far away with my handheld. Has anyone else noticed this kind of (apparent) "skip" in the 154MHz range recently?

Yeah, I know what you mean....and I'll grant all that heat in the
PRO-2004/5/6 series is a waste....of money, if nothing else. But it
also degrades other components in the scanner. Your perception of it
as a flaw is ..... well, hmmmmm ....<finding words> .... like mine,
except I don't call it a flaw, because it was done on purpose with
full knowledge of the tradeoffs. The AC side alone is a major
consideration of safety anymore.

If you study the AC side of these scanners, it can be seen where they
are almost inherently safe.....which they would not be if one of the
AC lines were switched, you see. Tough call, what we term this one,
but I will not argue "undesirable".

>Using the external supply just eliminates the biggest source of heat inside
>the box.

That, and the extra room for more mods is why I recommend that very
thing like you do. Remove the AC supply and run off external DC. A
rule of thumb for the compleat hacker. Kind of like breathing.....
BTW, almost all consumer electronic stuff nowadays runs from
non-switched AC supplies (The DC side is switched). That's one reason
why I can't call it a flaw.

> I personally don't find lower life expectancy "no cost", or
> desirable. It was simply cheaper for the manufacturer to build it that way,

Quite possibly a matter of law, too. Seriously, anything that plugs
into the wall socket is pretty much that way anymore.

> I simply meant to suggest that there are
>BETTER (and slighly more expensive) ways to meet all of these requirements.

Better for us, yeah. More expensive or problematical for the mfgrs,
though.

> My comment regarding using a REGULATED DC power supply stems from the fact

>probably not near as great a heat source as the internal (and marginally
>spec'd) AC transformer (which can also be a source of a healthy 60Hz field),
>voltage drop across regulators is also a major contributor to internal
>heat build-up.

Well, I dunno. I have thoroughly tested the PRO-2004/5/6 series and
frankly, there is reason to wonder about that. First of all, IC-9 is
a CMOS regulator, so no drop and no heat there. IC-8 is a 78L05 that
has the potential of what you say.....but.....if you were to insert a
millammeter in series with the OUT lead, you'd find a drain of about
50-mA. Any differential with that low of a drain will not create any
heat to speak of. Geez, even if the differential were 10 volts, the
dissipation would only be a half-watt.

The only other regulator in question is Q32, the +8v regulator
transistor......the drain through which is about 300-350mA. The
voltage drop across the transistor is about 3.7v, so power dissipated
as heat can be expected to be 3.7 x .35 = 1.3 watts, hardly nada when
sunk into the chassis. Yes, it counts, but not a whole lot of
anything, really.

So the thing to do is a more complete analysis of the Big Picture and
see what we can determine. Fer instance, Tandy specs the PRO-2006 to
draw 18-watts from AC power and 10-watts from DC power. Aha! That 8-
extra watts from AC must be pretty much dissipated in the power
transformer, T-801. But more on that later. First, let's deal with
what we know for sure.

1. IC9 drain is neglibible (microwatts)
2. IC8 drain is 50-mA @ 5-v = 0.25-watts
A. IC8 dissipation is 7v diff x .05 = 0.35 watts
3. Q32 drain is 350-mA @ 8.3v = 2.9-watts
A. Q32 dissipation is 3.7v x .35 = 1.3 watts
Another current path is the audio power amplifier, IC-7, and damn, I
forgot what I measured its drain to be but the service manual shows
the drop across R-224 to be 0-volts, so under quiescent condtions, the
power consumed by IC-7 must be negligible. Let's leave it at that for
a moment.

4. IC7 drain - quiescent, n/a; dynamic, unknown.

Then there is the drop across the main limiter resistor, R-229 (2.2-ohms), the current through which I have measured to be 400-mA. So power consumed is: (I)(I)(R) or = 0.35 watts.

Summarizing and combining: IC8 delivers .25 watts to the receiver and consumes another .35 watts. Q32 delivers 2.9 watts to the receiver and consumes another 1.3 watts. R-229 consumes .35 watts. The total DC power we can readily account for is: .25 + .35 +2.9 + 1.3 + .35 = 5.2 watts. Tandy says 10-watts, so that leaves 4.8 watts unaccounted, most of which can probably go into the audio power amplifier chip. Tandy spec's 1.3-watts audio output power. These chips are not very efficient, so its possible for the balance of 3.5 watts to be dissipated in IC7 and R224. I would tend to say half that is better which leaves 1.7 watts unaccounted for. For that, we go look at R-249 (1-ohm) the DC input limiter, which at 400 mA would dissipate 0.16 watts. Series diode D58 with a 0.6v drop at 400-mA would dissipate 0.24 watts. We're getting pretty close now, so let's hang the balance of 1.3 watts on the shelf as unused. Really, the scanner draws 8.7 watts from a DC source. If 1.3 watts goes out as audio, then 7.4 watts goes up in heat....some straight into the ambient air within the case and the balance into the chassis metal, thanks to heat sinking of IC8 and Q32.

While the heat sunk into the chassis will help heat the ambient air within the case, some of that heat will be radiated into the case and then into outside air. That part is safe. It's the heated air inside the case that degrades life expectancy.

Now we can make some strong inferences. Clearly, operating from external DC , a stock 2006 runs only marginally above ambient temperature. My heavily modified 2006 runs 10-deg C above ambient, quite tolerable, considering. A stock scanner will run half that or less.

Interesting, however, that an AC powered 2006 runs a good 20-deg C above ambient...maybe more. We can consider that the DC side of the AC powered circuit runs exactly the same as if it were powered from external DC, so the difference, clearly, is the extra 8 watts from the transformer that has nowhere to go but into the air inside the case.

Concluding then....our calculated 7.4 watts of heat dissipated by the receiver does not appreciably heat the air in the scanner. So a lot of that heat must be going into case and out into external air. That extra 8-watts from the transformer really makes the difference. Of course we knew that all along, but analyzing it is fun and it is educational to see where all that power goes.

My gut feel is that about 3-4 watts goes into the air inside the scanner and 4-5 watts into the case. The position for external DC power is strongly made. Not by us, but by the facts and the numbers.

We're quite in agreement here and have proved our case.

Bill

"parasitic"? Nice adjective.

> that have the need to speak their mind at the expense of others.

"Expense of others"? (Oh geez, here comes another cowboy. Gotta be a cowboy with that high-horse he's riding.....)

>We live in a great country, and have access to a great system of
>computer communication.

Got any clue as to WHAT made that possible?

> However, there are manic, grandiose personalities that insist upon
> irresponsibly using their free speech priveledge

"Privilege"? Oh, come now, cowboy! In which country did you study the first ten Amendments to the Constitution of the United States? Where did you learn how to spell "priveledge"?

> to annoy organized efforts of others.

Say what? Ha ha ha ha ha ha..... What a cowboy! You done lassoed yourself a turd, dude. "Annoy the organized efforts of others", my ass! When those efforts are wrong, it is traditional in THIS country to not only ANNOY, but to kick ass and take names. Bend over!

>I have no idea what this guys's problem is, because I usually don't
>spend much time reading garbage off topic posts.

Ahhhhhh, it all comes out now..... the cowboy doesn't know.....

> I do know that he like to call his critics "messiahs",

You can't possibly know that, cowboy, 'cuz it ain't true. Now what is true is that I see various and sundry folks who fancy themselves as messiahs and by the gods, they're going to set me straight and "save the newsgroup". <groan>

> while he speaks prophetically himself.

Snicker. Giggle.

> He needs an outlet to relax himself, unfortunately he
>hasn't chosen a newsgroup suited to his needs.

My goodness, you go from professing NOT to know in one breath and before you can open your mouth to change feet, you come off as knowing it all. That is characteristic of the cardinal reason WHY there are more horses asses in this world than there are horses. One great mystery now solved, thanks to you, cowboy.

>Well, as I said, I vented once on the subject, and that is that.
>Please, no one extend this thread.

Why not, cowboy? You think you can sneak in here; take a pot shot; and then call "King's X"? A real cowboy would stand up and take the heat. You ain't no cowboy. You're a rinestone cowboy riding a high horse and done lassoed yourself a steaming pile.

You wouldn't mind galloping back in to take a bow, would you? You're going to become famous for being my textbook example of how rinestone cowboys see the world from little windows in their bellies. This little saga will go down in legend as "The Cowboy and His High-Horse", and will be studied by shrinks all over the world as a classic . Cowboy, you done made Freud turn over in his grave. And your high horse done shit on your shiny boots. You done gave a whole new meaning to "shit-kickers".

Gooooooood job, cowboy. I get to go say my prayers now and thank my maker for not having to be in your shoes.......'er boots.

On KC5KTO's Radio Shack Scanner Page on the web, it states that there are two mods for the Pro-41......enable the Hi VHF range to be extended from 137-174 to 108-174. THis allows coverage of the Civilian Aviation frequencies, but the scanner is still in FM mode (not a very usable mod I guess).

The other mod allows you to switch the Lo VHF band coverage between the 30-54 Mhz band (stock) and the European 66-88 Mhz band.

I have seen no mods or info on the Pro-30.

Search the web, the mods are there, I don't have them, I just thought I would let you know that theoretically they exist.

Hmmm...It must have been someone using the same address and service as
you who just before Christmas posted adverts for the scanner interface
at a "special" price (twice) !

You know, it really is your "fat-head" attitude that turns people off.
I don't condone the 2-way BS that has been going on for years now
here and on the FIDONET between you and Andy Moss but he was right
in his latest post...you have an obnoxious and abrasive way of dealing
with confrontation...I noted this years ago. Maybe this is why I do
much more reading than spewing off at the keyboard.
I won't lower myself to respond to your childish limericks.
(You're like a big kid...can you say RESPONSIBILITY ? :)

It is however quite noticeable that this newsgroup was nice and
quiet (in a responsible sense) before you showed up...too bad you
couldn't stick to the FIDO Scanradio conference...or is it
the "Bill Cheek Scanner Mods Book support area" ?
Now is that conflict of interest or what...Bill Cheek...the man who
turns a profit from marketing scanner mods, moderating a non-commercial
Bulletin Board Network conference dealing with scanners !
(Oh ya...no commercial hooks over there, right ?)

I always meant to ask...did YOU design and write the code
for the scanner interface that you sell ? Thats the 2-way unit that
taps feedback from the LCD display right !? :) (Kludge)

West Allis PD(and other muni svcs.) are indeed on 857.9875 and 858.9875. I hear them on both of my scanners. They are trunked with Greenfield which uses 856.,857.,859.,and 860.4625. W.A. listeners are particularly fortunate, in that the control channel is always on Greenfield's group. We are ALL fortunate in that they chose to separate the two cities into freq. groups.

A "mod" is a modification, a change to an instrument that allows it to work
better or differently than the way it was delivered from the factory.

> Hello Dave

The following frequencies are used in the Houston area.

Life Flight - Hermann Hospital Dispatch 123.050
Helicopter/Ambulance to Hospital 155.340
Houston Fire Department EMS 462.950
Baytown Health Department EMS 462.975

Life Flight also shares a talk group on the Harris County trunked radio system, and has used it on occasion to pass information between the helicopters and the communications center.

> I need to know which freqs are Itinerant.

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Dot Frequencies

Dot color Other
Red 151.625 itinerant "J" Dot 467.7625
Purple 151.955 "K" Dot 467.8125
Blue 154.570 Silver Star 467.850
Green 154.600 Gold Star 467.875
White 462.575 GMRS Red Star 467.900
Black 462.625 GMRS Blue Star 467.925
Orange 462.675 GMRS
Brown 464.500 itinerant
Yellow 464.550 itinerant

"Dot" stickers are used by the manufacturer or distributer to
indicate the frequency of otherwise identical transceivers. They
are often found in rental inventories and on construction sites.
Additional itinerant frequencies include 27.49, 35.04, 43.04,
151.505, 158.400, 469.500 and 469.550 MHz.

>but I really don't know which would be better. I have never seen an
>in-depth comparison of the two.

As you've defined your application, only the CE-232 will do the job.
I have the CE-232 only, so my thoughts may be a little biased.

OPTO Advantages: Several software packages to choose from, although
they are extra cost to the hardware. Has more functionality in terms
of virtual scanner banks, CTCSS decoding, and more that I am
unfamiliar with. I think it will also scan faster, depending on your
computer and software package.
OPTO Disadvantage: This is a big one for me. The computer has to be
operating in order to use it. So if you set your scanner and computer
to searching for freqs while you're at work, you can listen to the
frequencies you've found when you get home, as long as you operate the
OPTO software on the computer. Shut it down, and your scanner forgets
all the frequencies you found, because they are stored on the computer
hard disk.

CE-232 Advantages: In the example above, with the CE-232, when you got
home, you could then tell the CE-232 to program the 2006 memory with
the frequencies it found that day. Then, shut down the CE-232
hardware and software to use your computer for other tasks, and listen
to those newly found frequencies using just the scanner. Another
advantage is that it has limited capabilities (auto program only) with
some portable scanners, so when you take that portable on trips, you
can use the CE-232 to load it up with frequencies for the area you are
travelling to. The CE-232 is open to interfacing with other widgets,
but you pretty much have to do all that yourself.

CE-232 disadvantages: It's a kit, maybe you can still buy it
assembled and installed, though, although I thought Bill Cheek stopped
that option. If you build the kit, its a pretty involved kit, and
it's not complete. You'll have to buy some more parts (cheap and easy
to get). The literature is OK, not great, in my opinion.

857. Comments on AR2700 and Scout

Newsgroup: rec.radio.scanner

I was happy with my current scanner until I read a copy of Popular Communications Communications Guide and saw the AOR AR2700. Does anyone have comments on this unit? Where in Southern California would I find it and are they typically discounted or sold at full list price? Is the AOR8000 significantly better to warrant twice the price?

I saw the Optoelectronics ad for the Scout which first piqued my interest in the the AOR scanners. Does the Scout work as well as advertised? I saw an ad for the AR8000 & Scout 40 reaction tuning MOD + cable pkg for $1039 or the same package with the AR2700 for $829 from Lentini Communications Inc in CT. Is this a good price and do I need to buy both units together (i.e. does the scanner itself have to be modified in any way?).

I know I'm loooking at the Big Bucks equipment now!

862. Modifying Unmodifiable scanners ?

Newsgroup: rec.radio.scanner
Date: 1996-01-11 00:00:00 UTC
From: charles1@netcom.com
Message-ID: <charles1DL18zM.GLq@netcom.com>
Source record: 242683

Has anybody looked into modifying the supposed unmodifiable
scanners? The best canidate would be a pre-ban model
that now meets law requirements. Perhaps PRO-43.
(I have no access to these schematics)

I imagine it could be modified in one of three ways:

1) If processor is custom chip, I would bet the external diodes
were replaced with internal fusable links. These are blown
at the factory to meet USA or Europe requirements, just as diodes did.
One could look at mask under a hi-powered microscope and determine if this
is so. The fusable links are usually located close to the wire pads.
The fusable links usually require a current sent thru two pins
of the chip to blow the appropriate links. If a link is blown to
disable cellular, there is no hope.

2) If a masked standard processor is used, perhaps someone could
pirate the code, hack it, and distribute it on the internet.
Hack would enable cellular band, a one bit change. Of course, the
processor would have to be pretty standard issue in order for one to
be able to burn the modified hacked code in a unburned processor chip.

3) I would bet the European versions still pickup cellular since
not illegal over there, or at least canada. Maybe Radio Shack
would sell the foreign cellular capable processor chips to whomever.

Any other suggestions?

Like the man said, if you can find another Radio Shack store. Like the rest of us, they are not all the same. Most of the time, I give my name because I know there is pressure from above to get them. Occasionally, I will be in a hurry and decline. The worst I have gotten in the past couple of years is a "Are you sure, we would like to send you a sale flyer". Most of the time, they just say, "OK", and go about finishing the sale.

have
BC>>convinced them, too. Yup, that's what "ignoring the bastards"
gets.

TS> I have no association with the above gentlemen. My observations
are independant.
TS> I see you've pissed off someone at Prentice...nice job..did you go
to school for that
TS> specialized form of marketing?

I am not in the newsgroup for marketing. Radio is my hobby, too.

If someone at Prentice Hall is pissed, so what? I have other friends
there, some well placed. <shrug>

If your observations are "independent", then why will you not confront
me with them in public in the offhand chance you failed to observe
very
clearly; i.e., you made a mistake?

You levied an accusation against me of profound magnitude. Why will
you not give me an opportunity to deal with it; to answer to it?
Obviously, your intentions are rather foul.

You're saying Hobby Radio and notably scanning would be better off
if you "killed me" or ran me off?

In response to my earlier post, that included the comment:

>>The Van Nuys area of Los Angeles is served by the Los Angeles City Fire

>>Department.

skarolek@execpc.com (Steve Karolek) wrote:

>Gee, after watching "Emergency" as a kid and idolizing Johnny Gage and
>Roy DeSoto, I had the impression that was a COUNTY operation. Is my
>memory foggy? Have things changed? Did the show's authors take
>liberties with reality?

No. They did not. The -CITY- of Los Angeles is an incorporated city of 468.8 square miles that is located entirely within the (larger) confines of the COUNTY of Los Angeles.

The 3.6 million (known) residents of the City of Los Angeles are protected by the (our) Class 1 rated "Los Angeles Fire Department" . Founded in 1886, the Department currently provides full-spectrum life safety services to America's second-largest City. This is NOT the agency portrayed in the television series "EMERGENCY!". That agency was the Los Angeles County Fire Department. To avoid confusion, we often refer to ourselves as the "Los Angeles -City- Fire Department".

>Thanks for participating in an official capacity. Its nice to see!

Steve, it is my pleasure. To learn more about the LAFD, you may visit our Internet Web Site at URL:

http://www.ci.la.ca.us/dept/LAFD/index.html

Be sure to visit our "Dispatch Center" page, that includes a full frequency list for our Department.

Sadly, our good friends at LA Co FD do not yet have a Web page or formal Internet presence.

I visit here twice daily. Please let me know in a public post (or E-Mail) if I can in any way be of assistance.

Stay Safe!

>the managers did anything wrong--I just don't understand what transpired.

Some years ago when i bought my first scanner, a Bearcat 210XLT (that
WAS a while back!), I collected freqs by going to various Radio Shacks
in the area & copying the lists they had available in the stores. The
list I compiled recently & offered the store was free - no strings
attached. It contained many freqs not in PC and was not intended to
replace any freq guide. I offered it as "repayment", if you will, for
the freqs I obtained from Shack stores years ago when I started
scanning. When I told the manager the above, I was told that "If it's
not in PC it doesn't exist" and "No radio Shack store has EVER had
freq lists available for copying". Since she was probably about 12
years old when I bought the 210 (NOT at the shack!!, at a local
appliance store) and had no way of knowing what their policys were
then, and since I don't like trying to reason with stupid people, I
left and haven't been back. I now go to a different Shack, when I
have no alternative, point at what I want, grunt, pay for it & leave.
That procedure seems to work quite well with the clerks there, btw.

Also, on their records my name is "Manual Labor"

- -
I don't understand - I cut it twice & it's still too short !

From: mulligan@ACM.ORG
Message-ID: <4d3hu5$rr2@hopper.acm.org>
Source record: 242692

Typical NiCad life in a PRO-43 is 6 hours for 600mah batteries. A test using standard R.S. NiCads with: Scan mode, minimum squelch, minimum volume (i.e. receiving, but no audio out) produced a battery warning at 6h 4m and a dead radio 9m later. Maximum audio would reduce this by 1/3. HiCap NiCads (850mah) would add 30-50%.
The current draw for a sample PRO-43 was: max. audio, 150ma; normal audio, 90-105ma; squelched, 85ma; battery-saver mode, 21ma.

Good idea. What a person might do is use 2 thin pieces of glass and
use some frosted plastic between them. Then possibly (not sure of the
room in there), use some bright grain of wheat bulbs and edge light
the whole mess. Kinda like they do on watches. For better esthetics a
person could put a bulb on all 4 edges to more evenly distribute the
light.

Last I heard Herman Hospital LifeFlight Houston was using a 800mHz trunk for it's primary comm. You can however monitor quite a lot of traffic and dispatch on the following freqs however...

155.3400 HAERN (Hospital Ambulance Emergency Room Network)
[Used by nearly all local (Harris County) Hospitals, EMS, Life Flight]

163.2500 Herman Hospital Emergency Medical Paging
(Life Flight/Trauma Alert)

123.0250 UNICOM (Clearance Coordination)
(Life Flight / HPD FOX / Media Helicopters)

123.0500 UNICOM (Helicopters) (Herman Hospital Life Flight / Media Helicopters)

128.8500 Herman Hospital - Life Flight Control
(Helo Status / Patient Reports)

Anybody know any additional info on Life Flight ? As far as I know, the helos are numbered Lifeflight 1, 2, 3 & 4. One of the LF helos had a serious mechanical problem a few years ago and it resulted in an on board fire. The pilot (what a guy !) made a quick emergency landing in the parking lot of one of the local malls and no one was hurt (bet they had to clean out some drawers though :)

I am also trying to figure out Houston Fire Department (HFD) EMS Medical (A, B, etc..) protocols, any have any info ???

Best Regards,

Schaumburg is on an 800 MHz trunked system. The voice is analog, and can be heard on a scanner. You will notice at times 2 data channels, as the MDT's are also on the system. Police, Fire, P/W and Village Operations are all on the system. ISPERN broadcasts also can be heard on the system thru a link. Occasionally other channels are linked as well, such as MERCI, MABAS, etc. All operations on the old Police Channel (155.550/156.015) and Fire Channel (154.235) has ceased.

857.9625, 859.2125, 859.7375, 859.9625, 860.9625.

See my book, ScannerMaster Illinois Communications Guide (800) 722-6701 or E-Mail me for further info if needed.

878. Recomendations for computer controlled scanner?

I am interested in purchasing a portable scanner / frequency detector system, and am interested in one which can be interfaced to a laptop.

Any recommendations?

Requirements:
Portable - i.e. small, battery powered.
Computer interface - any non-proprietary adapter form.
Full coverage - something that may be modified for all bands.
Documentation or software for hit logging, scan hits, etc.

Desired:
PL decoder!
Jack to pull the audio signal out cleanly for digital analysis.
Very small size.

Also, which magazines should I be looking at for discussions of these issues?

Thanks very much in advance for any help.

Look around your area for a Radio Shack DEALER store. If you can find one, do all your shopping there. These are private franchise stores... they do not have the ridiculous corporate policies (including "name and address") that the company stores employ. Plus, you will often find competing brands displayed right next to the Radio Shack versions of products, often providing better value and/or performance. Best of all, your money goes to a private businessperson and not to the corporate goons in Fort Worth.

> I have a simple question for the group (I hope).
> Can I bring my Hand Held Scanner to the US when
> I come over on vacation this March.

Yes, you may. If you plan to use it on the airplane, however, be descrete.

The US FAA regulations now prohibit the use of any transmitting or receiving device during takeoff or landing, and even in-flight I have heard stories of flight attendants who insist you turn your scanner off and put it away or they'll confiscate it!!

I have taken my hand-held to the UK, Europe, Mexico, and the South Pacific and never had a problem. Of course, I usually use an earphone and keep it out of sight. When traveling through airports, I detach the antenna from the handheld and stow both in my camera-bag (one of my carry-ons for the flight). So far, no Xray tech or inspector has questioned it and I guess they just assume it is part of my camera gear. Or maybe I've just be lucky!

..

In many areas, that's the way it goes.
Here's a tip: put all the frequencies for one agency (police, for example) in one bank, then scan all the frequencies in that bank. That way, you won't be just sitting on one frequency, waiting for action. Even here in Phoenix, when things are slow, the police frequencies will go silent for periods of over a couple of minutes (that's *all* the frequencies, over a dozen!).

> BTW, every now and again, I hear what sounds like Morse code.
>is it?

Probably. The FCC requires each station to ID itself at intervals. Morse Code is the way many public service stations do this, as it is a more positive ID than a voice, which can be garbled.

Don't get discouraged, hang in there. You'll get the hang of it.

>
> Anyone can advise me on the pros and cons thereof?

I had a pro-46 and returned it to get a cellular modifiable pro-51 date code 12A3. If you stil have the opportunity to do this I would recommend it. The 51 has 100 more channels, is smaller, and seems to have the same or better sensitivity. The pro-51 also has the feature of preprogrammed frequencies for fire, marine, air and weather which are very helpful for travel when you don't know that particular area's frequencies. The pro-51 with cellular is a steal at $199.99 it can't be beat. I also have the pro-26 which I use for military scanning and the pro-51 is very similar. I would highly recommend this but be sure to preform the cellular test before you buy because relying soely on date codes is risky.

good luck

steve

887. Good price for used Cub

Newsgroup: rec.radio.scanner
Date: 1996-01-11 00:00:00 UTC
From: soren@delerium.engr.arizona.edu
Message-ID: <soren-1101961823190001@yuma7.rescomp.arizona.edu>

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for
mobile use and comes with a cigarette lighter adapter although it can be
hard wired.
It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in
WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies
found in high-end scanners.

Hello,
I was wondering if there were any scanner clubs in or around
the san diego area. I would just like to meet with people with the
same interests and who enjoy scanners and monitoring as much as i do.
Thanks,
Dan Baxter danb@ix.netcom.com

891. FS: Opto Interceptor & Cell filter...

Newsgroup: rec.radio.scanner

From: batwing@digital.net
Message-ID: <4d1vh8$165@ddi2.digital.net>
Source record: 242734

Unit is used, and works fine, just unsuited to my needs.

Has the manual, charger and the $150 cellular filter.

This unit is on sale for $299 from Opto, so I want $275
with the filter (no, I won't sell it w/o the filter!) + shipping

No trades for scanners or anything else, sorry

Doug

892. US AIR & Disney

Hi Stu:

As far as I know, there is no law prohibiting a non-US citizen from bringing a scanner for his or her OWN use into the US. However, due to the ECPA, I would bring whatever papers proving ownership along with you.

Also, there are some states here (Florida, among others) that prohibit mobile use other than by licensed hams. Where are you planning to visit?

Welcome to the USA! (in advance of course)

David Crawford dcrmatt@vnet.net

hi
there is a shop in Lisburn N. Ireland which sell down converters for
around £49 GB this unit converts cellular freq down to the 130 - 160
megs it is infact an antenna about 9" long and takes 2 x AAA batts
no mods to the scanner at all. it has a BNC connection on the base
and will not only fit any scanner but they showed me it working on a
cheap £19.99 multi band radio that shop is called E-WORLD if your
interested +441846 605919 or if you want you can e-mail me and i'll
take it down to them for u ... what shipping will be ???
i'll ask him

Oh boy, sit back and watch these notes fly! I think you will find some
very strong opinions on the R1, most of them not very good. Without being
technical, because I'm not technical, I own both an R1 and a AR8000 and
the AR8000 wins hands down. The advantage of the R1 is size but it gives
up a lot to be that small.

899. Mall of America

Newsgroup: rec.radio.scanner
Date: 1996-01-11 00:00:00 UTC
From: skarolek@execpc.com

OK, I plead guilty as charged...

I know I've seen frequency lists for the Mall of America (Bloomington, MN) posted here, along with discussion about whether scanning is tolerated by mall security.

Unfortunately, I let 'em slide since I had no plans to visit anytime soon. As you've guessed by now I'm sure, I'll be in Bloomington (business trip to visit Kavouras re: a weather satellite data reception and interpration system) and am taking my wife and kids along for a "hotel vacation" (I am being forced to stay at the Embassy Suites <g>).

Anyway, I've "downloaded all headers" from alt.radio.scanner and rec.radio.scanner and I don't see any references to the Mall of America. I grabbed the FAF list from oak and don't see them there either.

I'd appreciate if someone could repost frequency lists for MoA for my listening pleasure next week. Thanks!

1. TRIDENT TR-2400 - Unblocked- New-Mint Condition.SSB and 1000 Channels covers from 500khz to 2.6Ghz ! Steps as low as 1 khz and adjustable. 10 Scan and search banks. 10db Att Button. AC adapter and 4 AA nicads. Has excellent sensitivity and sharp clear, loud audio ! Orig. Box, manual and all packing material. Includes a heavy duty leather case. This unit is new and has never been out of the house.
Looks something like a AOR 1000 but with a much better receiver and audio. Purchased at $449.95 plus $30.00 for the case. Will sell all for only $349. Includes free 2 day shipping to lower 48 states.

2. AOR-2500 Base / Mobile Scanner. Un blocked, mint condition, 100 khz to 1.5 Ghz. 2016 Channels, LCD display, RS232 port built in. 62 scan banks and 16 search banks. Comes with free software for DOS. Permanent Memory. Orig box,manual,antenna,AC Adapter, Looks brand new - never mobile. New at $ 499 now only $249.00 which includes 2 day shipping to lower 48. Many neat features on this radio. With included software it is an excellent value for the price.

3.Bearcat BC2500XLT- Hand held scanner. 400 channels, 20 banks, V.F.O. control, 20 banks, turbo scan. 25 to 1.3 Ghz, Cellular Blocked. Includes charger orig box and packing, nice case amd battery. Mint condition and never out of the house. Scans at 100 and can search at 300 channels per second! Will sell for $ 239.00.
If interested in any of these scanners please contact:
Gary Wilburn NI8K
Cincinnati, Ohio 513-732-1224
or ni8k@one.net

Thanks for reading all this !

You don't need to. I will. I warned Mister Peter (PjB) Breath to
stop sending me sexual propositions by e-mail. I've warned him twice.

A third time goes to my attorney.

It's not a threat so much as I just want him to stop the sexual
advances. Apparently he took me seriously. He stopped after two.

>>I have communicated the substance of your vicious lie below directly
>>to Mr. Parnass, and invited HIM to discuss it with both you and me on
>>this forum, in public. I am prepared. Are you?

>I don't have any questions, anything to resolve or discuss with you...

I didn't think so. Lying, cheap-shotting, low-lifes *can't* discuss
their fraudulent positions. Still, all in all, you made a bold-ass
statement.....vicious, nasty, foul, and ill-prepared. I really WISH
you'd back it up so that I can answer to it, one way or the other, as
I showed below and which you deftly tried to contort into evil:

>>Now let's set the record straight about Mr. Parnass. There was ONE
>>instance where I may have published something of his. It was in a
>>column for Monitoring Times a couple or three years back...where a
>>reader sent me a "procedure" for VLF tuning an ICOM R-71. I published
>>it in my column. A few months later, Parnass told Monitoring Times
>>the procedure was his. As far as I am concerned, it's hearsay and
>>unsubstantiated, but we apologized and that was that.

>plagiarizing is plagiarizing...plain and simple...it's good that others than
>truly see the other side of the "trustworthy" Bill Cheek.

No, shit-fer-brains, that was NOT plagiarizing. I acted in good faith
with no recourse but to accept the submitter's word or to reject it
out of hand. There was no latent reason to reject it.

>...even by your own admission it's ok to "copy just one"...
> or even attempt to justify it as you've done here.

I didn't say it was ok. I said it was beyond my control. I also said
it was hearsay and inferred that I didn't know the "facts" of the
matter. Mr. Parnass never communicated with me. I don't know the
substance of his claim to the subject matter. All I know is that a
reader submitted the material to me and I wrote part of an article
around it. There's no evil there. No intent to deprive Mr. Parnass
of his rightful due. What the hell's the difference to me? I render
credit to one and to another.

One thing is for sure, though, fella....there is no "Bob Parnass"
material in my books. Neither is there anyone else's material UNLESS
I said so.....and I certainly did say so where appropriate. My
books are quite liberal with the credits.....which anyone with an
asshole for an eye can plainly see. Surely that sphincter for an
eyesocket you have can see just as clearly?

> The unsuspecting "newbies" may think you contributed a great deal to
>the hobby...but the proof's out there for those interested to research it
>further.

Well, let's "research" it, then. Here I am. Ready to be confronted
with "the facts". Are you so unprepared that you can't whip them
out? Well, I sent e-mail to Mr. Parnass, copying your lack of candor,
so maybe he will make a statement of some sort tomorrow.

>Your emotional outcrys only prove how immature and unprofessional
>you really are

Wait. I don't know you from Lavender Larry. I've never said a word
to you or about you in my Life, of which I am aware. So now you step
up on the stump to lie between the gap in your teeth about me, and I'm
"immature and unprofessional"? You are one strange degenerate, Smith.
Clearly, your tribe steps to a different drummer than mine. I play
a two-way street. You're like a diode. One-way. That's the epitome
of the definition of "immature and unprofessional".

> Anyone can see that the only thing you have contributed to the hobby
> is the cash in your pocket.

Ahhhhhhh, here it comes..... you're pissed because I won't work for
you for free. It's all starting to make sense now..... It's
an age-old syndrome where a few low-rent, welfare hobbyists think
they should be given handouts because they won't work for a living.
You've said it all now, Smith.

> There's no harm in good old commercial enterprise but geez...
> let's be original.

Oh, I am, Smith. I am THE original. And anything I publish is either
all mine, or credited in good faith to those whom I think it came
from, and in most cases I KNOW who it came from. Your statements to
the contrary are totally untruthful......or stupid. One or the other.

> This is the last you'll hear from in a public newgroup on the subject...

Naturally. You can't stand the heat. You CAN'T back up your lies or
stupidity or both. But if and when you think you can, load up your
lugnuts and get up here on the stump WITH me. I am here waiting for
you. And I am real patient. I can wait until hell freezes over,
Mister Smith.

>cheap you've been know to get.

YOU took the cheap shot, Smith. You lied and then ran, showing that
yellow highway stripe between your cranium and your poop chute.

> Any inquiries on plagirizing issues can directed via private email.

(There's the yellow stripe.) Nope. You dribbled those issues out
from the hole in your lip right here in public, so this is the best
and the only place to settle the matter. Look dude, you hate me so

much for whatever reason, this is YOUR chance to knock me out of the saddle and get rid of me. For good. There's no way I can hold my head high if caught in a lie or a plagiarizing scam. You made the statements. You must have the backup. Whip it out and do me in, pal. Or, are you afraid you will be proved a liar?

Bill Cheek

917. Review of the PRO-2004 Scanner

in the February 1987 issue of The Radio Enthusiast
and March 1987 Monitoring Times magazine:

The Radio Shack PRO-2004 Programmable Scanner

Copyright 1987 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part in bulletin boards, networks, or publications which
charge for service without permission of the author.]

Manufactured in Japan, by General Research Electronics, the
Radio Shack PRO-2004 is a 300 channel, wide coverage
scanner radio, incorporating NBFM, WBFM, and AM modes.

Although the catalog description doesn't do the radio jus-
tice, the microprocessor circuitry provides features not
found in other base/mobile scanners.

This review, although admittedly subjective, focuses on
three broad characteristics: feature set, basic electrical
performance, and mechanical construction.

Frequency Coverage

The PRO-2004 literature states that coverage is continuous
from 25-520 and 760-1300 MHz. Radio Shack's last minute
decision to remove cellular telephone frequency coverage
from the PRO-2004 caused a 7 week delay in its introduc-
tion. A small card is now packed with each scanner,
informing the buyer that the radio will not operate in the
825-845 and 870-890 MHz ranges.

A matrix of diodes, attached to the microprocessor's input
port, is often used to configure radios for sale in dif-
ferent markets. From recent flux on the circuit board, it
appears that a diode has been added or removed from my
PRO-2004, and this may be how the cellular telephone cover-
age was yanked.

Lots of Memory

The PRO-2004 has the usual features that scanner buffs have
come to expect: individual channel lockouts, selectable
rescan delay, an external speaker jack, etc. But, the 300
channel capacity of the PRO-2004 sets an industry record!

Casual scanner users may scoff at the usefulness of having so many channels, but seasoned monitorists can have those channels filled up in no time flat, especially with frequencies in the vast 225-400 MHz military air band.

- 2 -

With so many channels to program, one dreads the thought of a power failure, which could clear memory in a hurry. Not to worry, the PRO-2004 memory is backed up by a conventional 9 volt alkaline battery (not supplied). The 300 channels are divided into 10 banks of 30 channels each, and one can select or deselect any channel bank from the scan list. Individual channels can be locked out in the customary way, but the PRO-2004 provides a new feature, a LOCKOUT REVIEW. Successive depressions of this key step through the locked out channels.

The owner's manual refers to the ability to delete a channel by storing a 0 frequency in it, not a particularly useful exercise. The scanner will still spend time scanning a "deleted" channel unless it is locked out with the LOCKOUT key, which then means it appears in the lockout list when using the LOCKOUT REVIEW feature.

Scanners worth their keep have a priority feature, with channel 1 usually designated the priority channel. The PRO-2004 is more flexible; any of the 300 channels may be designated the priority channel. When the PRIORITY key is depressed, that channel will be sampled every 2 seconds, and the radio will stay there if a signal is heard.

The PRO-2004 has two scan speeds, 8 and 16 channels/second, although one would probably use the faster speed in most instances. This compares favorably with 14 channels/second speed of the Bearcat 800XLT.

When programming a channel, the PRO-2004 firmware sets the mode automatically, based on its idea of what mode is most prevalent on that frequency. This feature saves extra keystrokes, and makes one appreciate the thought that went into the design of this radio. The default mode can be overridden easily, if need be, like to listen to a NBFM satellite in the 225-400 MHz range, which is mainly populated with AM signals.

Searching

The SEARCH facility found on most programmable scanners allows the entry of a pair of frequencies, then by pressing a key, the radio searches frequencies between those limits. The PRO-2004 allows for 10 pairs of limits! These pairs of limits are stored in their own memory, and don't use up any

of the conventional 300 memory channels. One can set up several search pairs, for instance:

- 3 -

- 46.610-46.970 MHz: cordless telephones

- 144-148 MHz: the 2 meter ham band

- 30.01-30.56, 32-33, 36-37 MHz: US Govt

Another unique feature is the MONITOR key, which stops the search and stores the frequency in one of ten special monitor memories. These memories are separate from the 300 main memory channels. The search can be restarted from where it left off by striking the up or down arrow key.

The user can select the search direction (up or down), and step size of 5, 12.5, or 50 KHz, although the PRO-2004 is intelligent enough to select a default step size based on the frequencies being searched. The owner's manual claims that a step size of 30 KHz is also available, but apparently this step size was disabled when the cellular telephone frequency coverage was removed.

The selected parameters are displayed on the LCD panel. Search speed is switchable between slow and fast, with fast search being about 14 increments/second (versus 12 for the 800XLT). For a 12.5 KHz increment, this translates to 11.2 MHz/minute (versus 9.6 MHz/minute for the 800XLT).

The DIRECT key allows one to start searching up or down from whatever frequency is on the display. Let's say the scanner is in MANUAL mode, and set at channel 26, which contains 460.100 MHz. Striking the DIRECT then UP-ARROW keys starts the PRO-2004 searching upwards from 460.100. This is a nice feature.

The PRO-2004 contains a "window detector" circuit, which is called into play during a SEARCH operation. This circuit tries to detect when the radio is tuned close to the center frequency of a station, and prevents the search from halting prematurely, off to the side of the signal.

The AFC (automatic frequency control) circuit of the Bearcat 800XLT often causes a search of 850 MHz signals to halt prematurely. Even though the signal sounds on frequency, the display reads the wrong frequency. The PRO-2004 does not have this problem.

Another interesting feature is the SOUND SQUELCH, which may be used during scan or search operations. With the the sound squelch enabled, signified by a red lamp above the pushbutton, the scanner will skip over unmodulated signals.

This is handy for skipping over "birdies", or link signals with a constant carrier.

- 4 -

According to the owner's manual:

- "When the PRO-2004 stops at a frequency which has no sound, it remains there for 0.5 seconds, and then goes to the next frequency if" no sound is detected "within that time."

"When a frequency which contains sound is received, it halts at the frequency. But,

a. If the sound ceases during the reception, it stays on the frequency for 5 seconds, and resumes scanning."

b. "If the [station] stops sending a carrier, the unit reverts to scan [or search] immediately if DELAY is off, after 2 seconds, if the DELAY is active."

The manual warns that the sound squelch may be fooled by signals with low modulation, and skip over them. The PRO-2004 SOUND SQUELCH tries to detect the presence or absence of modulation (not human speech), so unfortunately, it thinks that mobile phone idle tones, digital data signals, and paging tones are worth monitoring and will stop the scanner to listen to them.

Taping Facility

A tape recorder can be connected to the TAPE phono jack on the rear panel, which provides 600 mV of audio at a 10,000 ohm impedance. In addition to a rear mounted external speaker jack, there is a headphone jack on the front of the scanner.

The PRO-2004 lacks a COR (carrier operated relay) output, like ICOM R7000 and old Bearcat 250 have, which would be useful for actuating a tape recorder.

Basic Performance

To evaluate sensitivity, the $400 PRO-2004 was compared with a $950 ICOM R7000 and a $300 UNIDEN/Bearcat 800XLT. Since a signal generator was not used, quantitative measurements could not be made. Instead, various antennas were switched between radios, signals from stations were compared by ear, and the results tabulated.1

- 5 -

Simply put, the PRO-2004 is sensitive enough to allow one to hear what needs to be heard, and not so sensitive as to be overloaded by strong signals. On 850 MHz, signals were readable on the PRO-2004 which couldn't even be detected on the R7000.

Although the 800XLT is the most sensitive radio of the three tested, it suffers from images and overload much more than the PRO-2004 or R7000. The PRO-2004 has a 10 dB attenuator, operable by a slide switch on the rear, but its use has been unnecessary thus far.

The up conversion design of both the ICOM and Radio Shack units allows use of a very high IF (intermediate frequency), which helps avoid image problems. The PRO-2004 owner's manual doesn't list the IF frequencies directly, but a good guess is that the first two IFs are 610 MHz and 70 MHz. The third IF looks something like 455 KHz when using AM or NBFM, and perhaps 10.7 MHz when the WBFM mode is selected.

The PRO-2004 is slightly more selective on NBFM than the 800XLT. WBFM selectivity is rated at about twice as wide as the ICOM R7000.

The audio output quality is good, although it seems to lack the punch of the 800XLT audio. The top mounted speaker directs the sound at the ceiling, but adding an external speaker would allow the sound to be directed at the user.

Unfortunately, the audio level of AM signals is somewhat below that of NBFM signals, requiring a different setting of the volume control. When scanning both AM and NBFM modes, one has to find a compromise position of the volume control.

The PRO-2004 squelch control has a bit too much hysteresis, a trait inherited from its ancestors. It's like having too much play in a car's steering wheel, or backlash in a gear set. This hysteresis forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The Bearcat 800XLT has this trait also, but the fix is simple. I've successfully eliminated this problem completely by replacing a single resistor on the 800XLT, as

---

1. Sensitivity comparison results appear elsewhere in this article.

well as the PRO-2002, PRO-2003, and PRO-24 scanners.

Mechanical Construction

The PRO-2004 is heavy. It is enclosed in a metal cabinet, but has a plastic front panel. If one is going to pay $400, one deserves to own some metal. The entirely plastic cabinet of the older PRO2003 allowed wideband noise to radiate out of the scanner and into nearby shortwave receivers.

There is a single BNC antenna connector on the rear of the PRO-2004, and a single telescoping antenna is supplied. This differs from the 800XLT which has 2 "Motorola type" antenna connectors, one reserved for the 800 MHz band.

Internal construction is excellent. Most stages are completely enclosed in their own individual shielded boxes. Interstage shielding is very important in a wide band receiver, to prevent it from "hearing itself", an undesirable phenomena which results in birdies.2 The shielding is much better in the PRO-2004 than in the 800XLT, which uses no shielding around the 800 MHz converter stage, and probably accounts for some of the birdies in the Bearcat.

Frequencies and other indicators are displayed on a backlit LCD (liquid crystal display) panel, and the level of backlighting can be dimmed by a pushbutton switch.

The flat membrane keyboard has a nice feel. Only slight pressure is required for actuation, and key depressions are confirmed by a mild "beep" audio tone.

The PRO-2004 might be too large to fit under the dashboard of compact cars. Although it can be operated on 12 VDC, neither a mobile power cord nor mounting bracket are provided. These items were included with earlier Radio Shack models. The AC power cord is not detachable, and would have to be bundled up to keep it out of the way in a mobile installation.

---

2. The PRO-2004 owner's manual lists 53 birdie frequencies, although 16 of these (or 30%) are above 900 MHz. The birdies at 29.635, 155.124, and 464.250 MHz are close to frequencies of interest and may interfere with reception.

Owner's Manual

The user manual suffers from Japanese to English translation problems, but is fairly good, resembling other Radio Shack scanner manuals.

A single page frequency allocations chart is included, but is not current. There is a very simplified block diagram,

but no schematic. The Maintenance section contains a useless troubleshooting chart, accompanied by advice like "keep it dry" and "do not drop". Thankfully, detailed service manuals for Radio Shack scanners are usually available for $5.00 or $7.50.

The PRO-2004 is warranted for 1 year, which is reassuring.

What's Missing?

So with all these neat features, what's missing from the PRO-2004? A "search and store" mode, like that on the ICOM R7000 and older Bearcat 250 would have been nice. A lighted keyboard and a signal strength meter would also be welcome.

Summary

If all one wants is a scanner to monitor local police and fire, there are certainly cheaper and simpler models than the PRO-2004. This scanner is for those who enjoy actively exploring voice communications in the VHF/UHF spectrum.

The PRO-2004 has the right features and performance, especially for scanning the wide 225-400 MHz military aircraft band. Good design should not to be taken for granted. GRE engineers used the power of the microprocessor to implement useful features in the PRO-2004. Similar processing horsepower was not used so wisely in a recent Yaesu scanner.

At about $400, the PRO-2004 provides a good alternative to those not wishing to spend $950 for an ICOM R7000.

TABLE 1. Sensitivity of Radio Shack PRO-2004 vs. ICOM R7000

Band	PRO-2004	R7000

Note: This is a reprint of an article published in the June 1989 issue of The Radio Enthusiast:

THE RADIO SHACK PRO-2005
PROGRAMMABLE SCANNER

Copyright 1989 by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

Manufactured in Japan by General Research Electronics, the Radio Shack PRO-2005 is a 400 channel, wide coverage scanner radio, incorporating NBFM, WBFM, and AM modes. It is the successor to the PRO-2004, the super scanner which put Radio Shack out in front of its competition in the base station scanner market.

The 2005 is basically a 400 channel PRO-2004, built using surface mount components, and housed in a smaller package.

Frequency Coverage

Radio Shack's last minute decision to remove cellular telephone frequency coverage from the PRO-2004 caused a 7 week delay in its introduction. The PRO-2005 appeared in the stores promptly on the heels of the 2004 closeout sale. Both the PRO-2004 and PRO-2005 cover 25-520 and 760-1300 MHz, except for 2 gaps in the cellular telephone bands. The two gaps in the 800 MHz range can be restored in either scanner by clipping a diode.

A matrix of diodes, attached to the microprocessor's input port, is often used to configure radios for sale in different markets. The diode matrix on new the PRO-2005 is located on the vertical circuit board just behind the front panel. There are 2 diodes present, and holes drilled for 2 more.

Lots of Memory

The PRO-2005 has the usual features that scanner buffs have come to expect: individual channel lockouts, selectable rescan delay, an external speaker jack, etc. But, the 400

channel capacity of the PRO-2005 sets another an industry record, just as the 300 channel PRO-2004 did! Casual scanner users may scoff at the usefulness of having so many channels, but seasoned monitorists can have those channels filled up in no time flat, especially with frequencies in the vast 225-400 MHz military air band, and other federal government allocations.

With so many channels to program, one dreads the thought of a power failure, which could clear memory in a hurry. Not to worry, the PRO-2005 memory is backed up by a conventional 9 volt alkaline battery (not supplied). The 400 channels are divided into 10 banks of 40 channels each, and one can select or deselect any channel bank from the scan list. Individual channels can be locked out in the customary way, but the PRO-2005 maintains the handy feature introduced in the PRO-2004, a LOCKOUT REVIEW. Successive depressions of this key step through the locked out channels.

Scanners worth their keep have a priority feature, with channel 1 usually designated the priority channel. The PRO-2005 is more flexible; any of the 400 channels may be designated the priority channel. When the PRIORITY key is depressed, that channel will be sampled every 2 seconds, and the radio will stay there if a signal is heard.

The PRO-2005 has two scan speeds, approximately 8 and 16 channels/second, although one would probably use the faster speed in most instances. This is the same speed as the stock PRO-2004, as measured by your reviewer. A diode could be added to the PRO-2004 diode matrix to speed up the scan and search rates by 25%. The provision for extra diodes in the diode matrix makes one hopeful that the same speedup trick can be applied to the newer PRO-2005.

When programming a channel, the PRO-2005 firmware sets the mode automatically, based on its idea of what mode is most prevalent on that frequency. This feature saves extra keystrokes, and makes one appreciate the thought that went into the design of this radio. The default mode can be overridden easily, if need be, like to listen to a NBFM satellite in the 225-400 MHz range, which is mainly populated with AM signals.

Searching

The SEARCH facility found on most programmable scanners allows the entry of a pair of frequencies, then by pressing a key, the radio searches frequencies between those limits. The PRO-2005 allows for 10 pairs of limits! These pairs of limits are stored in their own memory, and don't use up any

of the conventional 400 memory channels. One can set up several search pairs, for instance:

- 46.610-46.970 MHz: cordless telephones

- 144-148 MHz: the 2 meter ham band

- 30.01-30.56, 32-33, 36-37 MHz: US Govt

Another unique feature is the MONITOR key, which stops the search and stores the frequency in one of ten special monitor memories. These memories are separate from the 400 main memory channels. The search can be restarted from where it left off by striking the up or down arrow key.

The user can select the search direction (up or down), and step size of 5, 12.5, or 50 kHz, although the PRO-2005 is intelligent enough to select a default step size based on the frequencies being searched. As on the PRO-2004, there is a hidden step size of 30 kHz, but apparently this step size was disabled when the cellular telephone frequency coverage was removed.

The selected parameters are displayed on the LCD panel, smaller than the panel in the PRO-2004. Search speed is switchable between slow and fast, with fast search being about 14 increments/second (versus 12 for the Uniden/Bearcat 800XLT). For a 12.5 kHz increment, this translates to 11.2 MHz/minute (versus 9.6 MHz/minute for the 800XLT).

The DIRECT key allows one to start searching up or down from whatever frequency is on the display. Let's say the scanner is in MANUAL mode, and set at channel 26, which contains 460.100 MHz. Striking the DIRECT then UP-ARROW keys starts the PRO-2005 searching upwards from 460.100. This is a nice feature.

The PRO-2005 contains a "window detector" circuit, which is called into play during a SEARCH operation. This circuit tries to detect when the radio is tuned close to the center frequency of a station, and prevents the search from halting prematurely, off to the side of the signal.

The AFC (automatic frequency control) circuit of the Bearcat 800XLT often causes a search of 850 MHz signals to halt prematurely. Even though the signal sounds on frequency, the display reads the wrong frequency. Neither the PRO-2004 nor the PRO-2005 have this problem.

The PRO-2005 includes a SOUND SQUELCH, resembling the VSC circuit on the Icom R-7000, which may be used during scan or search operations. With the the sound squelch enabled,

signified by a red lamp above the pushbutton, the scanner will skip over unmodulated signals. This is handy for skipping over "birdies", or link signals with a constant carrier.

The manual warns that the sound squelch may be fooled by signals with low modulation, and skip over them. The PRO-2005 SOUND SQUELCH tries to detect the presence or absence of modulation (not human speech), so unfortunately, it thinks that noisy dead carriers, digital data signals, and paging tones are worth monitoring and will stop the scanner to listen to them.

Taping Facility

A tape recorder can be connected to the TAPE phono jack on the rear panel, which provides 600 mV of audio at a 10,000 ohm impedance. An audio filtering circuit rolls off the high frequency components before they reach the TAPE jack, which makes it impossible to use it for picking off FM subcarrier signals. In addition to a rear mounted external speaker jack, there is a miniature headphone jack on the front of the scanner.

The PRO-2005 lacks a COR (carrier operated relay) output, like ICOM R7000 and older Bearcat 300 have, which would be useful for actuating a tape recorder.

Basic Performance

To evaluate sensitivity, the PRO-2005 was compared with it's father, the PRO-2004. Since a signal generator was not used, quantitative measurements could not be made. Instead, an Antenna Specialists AV-801 antenna was switched between radios, signals from stations were compared by ear, and the results tabulated.

Simply put, the PRO-2005 proved moderately more sensitive than the PRO-2004 on most bands tested, and just slightly more sensitive on a few bands. The cost one pays for the 2005's increased sensitivity is having to put up with hearing 800 MHz trunked systems and cellular telephone conversations while searching the 118 - 132 MHz commercial aircraft band. The 800 MHz interference was heard only on the 2005, not the 2004. Other than that, intermodulation interference from paging affected both scanners to the same degree, and on the same frequencies.

Although both the 2004 and 2005 can suffer the effects of intermod, they are much more immune than the overly sensitive, image laden Bearcat 800XLT. The PRO-2005 has a 10 dB attenuator, operable by a slide switch on the rear.

The up conversion design of both the ICOM R-7000 and Radio Shack PRO-2005 allows use of a very high IF (intermediate frequency), which helps avoid image problems. The PRO-2004 owner's manual contains a frequency allocation chart and a section on images. This section appears in the manuals for other Radio Shack models, and was thoughtlessly thrown into the 2005 manual. It babbles on about images being 21.4 MHz away from the real frequency -- true for simpler models, but not so for the PRO-2005.

The audio output quality is good, although the top mounted speaker directs the sound at the ceiling, but adding an external speaker would allow the sound to be directed at the user.

Unfortunately, the audio level of AM signals is somewhat below that of NBFM signals, requiring a different setting of the volume control. When scanning both AM and NBFM modes, one has to find a compromise position of the volume control.

The PRO-2005 squelch control has a wee bit too much hysteresis, a trait inherited from its ancestors. It's like having too much play in a car's steering wheel, or backlash in a gear set. This hysteresis forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. It's not as sloppy as in the early PRO-2004s. I've successfully eliminated this problem completely by replacing a single resistor on the 800XLT, as well as the PRO-2002, PRO-2003, PRO-2004 and PRO-24 scanners.

Mechanical Construction

The PRO-2005 is lighter than the 2004. It is enclosed in a gray plastic cabinet, with a plastic front panel. If one is going to pay $420, one deserves to own some metal, but several stages are internally shielded in their own metal compartments. The entirely plastic cabinet of the older PRO2003 allowed wideband noise to radiate out of the scanner and into nearby shortwave receivers.

The PRO-2005 vertical front panel is an advancement over the sloping panel of the 2004. Now you can stack the scanner on top of other equipment and see the controls without standing up. If sitting directly on a table, two hinged plastic feet, padded with rubber bumpers, can fold out from under the front of the radio to tilt it at a good viewing angle.

There is a single BNC antenna connector on the rear of the PRO-2005, and a single telescoping antenna is supplied.

Internal construction is excellent, and the internal shielding is commendable. Interstage shielding is very important in a wide band receiver, to prevent it from "hearing itself", an undesirable phenomena which results in birdies. The PRO-2005 owner's manual lists the birdie frequencies. The shielding is much better in the PRO-2005 than in the 800XLT, which uses no shielding around the 800 MHz converter stage, and probably accounts for some of the birdies in the Bearcat.

Frequencies and other indicators are displayed on a backlit LCD (liquid crystal display) panel, and the level of backlighting can be dimmed by a pushbutton switch.

Vision impaired scanner buffs will appreciate the conventional raised rubber keyboard in the PRO-2005, which replaced the flat membrane keyboard in the PRO-2004. Only moderate pressure is required for actuation, and key depressions are confirmed by a mild "beep" audio tone.

The PRO-2005 is the right size to fit under the dashboard of intermediate sized cars. Although it can be operated on 12 VDC, neither a mobile power cord nor mounting bracket are provided. These items were included with earlier, pre-PRO-2004 Radio Shack models. The AC power cord is not detachable, and would have to be bundled up to keep it out of the way in a mobile installation.

Owner's Manual

The user manual is outstanding compared with the fold out sheet furnished with Uniden scanner.

A single page frequency allocations chart is included, but is not current. There is no schematic. Thankfully, detailed service manuals for Radio Shack scanners are usually available for $7.50 or $10.00.

The PRO-2005 is warranted for 1 year, which is reassuring.

What's Missing?

So with all these neat features, what's missing from the PRO-2005? A "search and store" mode, like that on the ICOM R7000 and older Bearcat 250 would have been nice. A lighted keyboard and a signal strength meter would also be welcome, as would a mobile mounting bracket and SCA output jack.

Summary

If all one wants is a scanner to monitor local police and fire, there are certainly cheaper and simpler models than the PRO-2005. This scanner is for those who enjoy actively exploring voice communications in the VHF/UHF spectrum. If

you already own a PRO-2004 and have added the diode to expand it to 400 channels, there is little to be gained by purchasing a new PRO-2005 -- unless, of course, you are a passionate scanner collector.

The PRO-2005 has the right features and performance, especially for scanning the wide 225-400 MHz military aircraft band. Good design should not to be taken for granted. GRE engineers used the power of the microprocessor to implement useful features in the PRO-2005. Similar processing horsepower was not used so wisely in the Yaesu FRG-9600.

At about $420, the PRO-2005 provides a good alternative to those not wishing to spend $1050 for an ICOM R7000.

Don't we all. The PRO-26 cannot be modified for cellular
reception, nor can any other scanner manufactured or imported
after April, 1994. There are a couple of roundabout exceptions,
but those require reprogramming the EEPROM. The PRO-26 is
not one of those.

Alas. 'Sniff.

Bill
tsmith@ici.net (Tim Smith) writes:

BC>Bottom line is that you have an axe to grind and we're going to
BC>get to the bottom of it. I can't imagine what, but your lack of
BC>candor and vicious attack is more than provocative.

TS> But doesn't your reation to my lack of candor tell the populas somethhing?

It should scream I am not afraid to deal
with your allegations up front, in public.
When a person has something to hide, he really
doesn't want it laundered in public, now does he?

Kind of like how you don't want to discuss
this on the public forum anymore. You're a
sleazeball liar and it is probable that I
can prove it with facts if we deal in public
where you spewed the venomous lies.

TS> Most personalities would simply ignore an alegation
TS> if there were no truth...

Would they now? Have you ever wondered why there are
so few or no "personalities" live and up front on the
radio newsgroups? Do people lie about them, too?
No wonder they're not present.

And it depends on the allegation. If you spouted
that I knew nothing about scanners, that would be
laughable and ignorable. To accuse me of plagiarizing

in general, is in-between. Maybe good for a chuckle
and a retort. To accuse me of plagiarizing Bob Parnass'
work is utterly despicable; not funny; and not ignorable.

Furthermore, your lying casts a pall over Mr. Parnass, too.
You see, questions immediately arise out of your mindless
thoughtlessness:

"Does your allegation that I plagiarized Mr. Parnass'
work come from YOU, or does it come from HIM?" "Did you
hear something from HIM on this note?" "Is HE saying
I plagiarized his work?" If HE said it, then I need
to deal with HIM.

Plagiarizing is WRONG. If a wrong has been done, then
it needs to be made right somehow. I don't know what
needs to be made right until it is established that
you're lying or telling the truth. You can't possibly
be telling the TRUTH unless you heard it from Mr. Parnass.

If so, I need to deal with *him*; not you.

Yet, in my good conscience and knowledge, I have not
plagiarized any works of others, and it is a gut-shot
that you blew Moss's trumpet. This matter now needs a
resolution.

When a lying sonofabitch steps over that fine line
between harmless and harmful, all bets are off. Your
spew is designed to cause me harm and loss. I am not
playing to the crowd, Smith. I am taking to YOU. But
you spewed your venom in public; we will resolve it there.

I am just a dude, Smith. I have a life, a livelihood,
and a family, all of which are within the target of your
vile, nasty lies. You went for my juglar; the kill.

Pardon me if I counter....not with lies, but with truth.
And I will deal with it until the matter is resolved.

In public.

I have had the same problem! Mine happened when I droped the radio (2
feet). Same issue - the top inside pin goes flat. It only happens when
the radio is on. The power pulse must do the dammage. I also had it
happen when I pulled the low batteries out with the radio on. My solution
is a wierd one. I lost the battery cover one day when it fell off as I
was walking (the cover never fit great). I used a wide piece of packing
tape to hold the batteries in - looks wierd but did the job. It takes
care of the problem by holding the battery with the lose pin, in very
tight. I have had no reset problem since then as there is no movement of
that battery. I know how pissed I was having to input over 900 freq's.
The first time it happened I was in Russia and had no freq lists with me.

I believe Charles Copeland did the first cross post to the non scanner radio groups. As I e-mailed to Mr Copeland this flame war is of little interest to the non-scanner crowd.

Bill Cheek you are doing yourself much more harm than good reputation wise by posting before regaining your temper. I have read your books and columns and in the past had some respect for you and your efforts. I too, have a temper, but your postings particularly with the challenges and foul language do little to shore up your public image. If the intent of your adversaries is to make you look bad you are helping them tenfold with your "defense". I know my respect for you has been diminished and I am sure the respect of others has also.

Hi,
When you make a mod to a radio and it calls for removeal of a diode
or other part keep this in mind. Whenever you change something try to do
it in a way that it can be reversed. Yout never know when you may want to
put it back. It is like getting a haircut, you can take mor off but you
can't put it back. I have been an amateur radio op for aoubt 10 years and
a tecknician for over twenty years and made a lot of mods.

The advice to cut the lead on one end of the diode is a good one.
cut it at a point where you can resolder it if you need to. Not too close
to the board or too close to the body of the componant.

>to Mr. Parnass, and invited HIM to discuss it with both you and me on
>this forum, in public. I am prepared. Are you?

I don't have any questions, anything to resolve or discuss with you...just making an honest observation...no cheap shots...even by your own admission it's ok to "copy just one"...or even attempt to justify it as you've done here. The unsuspecting "newbies" may think you contributed a great deal to the hobby...but the proof's out there for those interested to research it further. Your emotional outcrys only prove how immature and unprofessional you really are and quite frankly as I mentioned in my personal email to you it'c becoming quite entertaining. Anyone can see that the only thing you have contributed to the hobby is the cash in your pocket. There's no harm in good old commercial enterprise but geez...let's be original. This is the last you'll hear from in a public newgroup on the subject...no matter how low and cheap you've been know to get. Any inquiries on plagirizing issues can directed via private email. In closing..remember it was you that casts doubt on your own ethical convictions as follows:

>Now let's set the record straight about Mr. Parnass. There was ONE
>instance where I may have published something of his. It was in a
>column for Monitoring Times a couple or three years back...where a
>reader sent me a "procedure" for VLF tuning an ICOM R-71. I published
>it in my column. A few months later, Parnass told Monitoring Times
>the procedure was his. As far as I am concerned, it's hearsay and
>unsubstantiated, but we apologized and that was that.

plagiarizing is plagiarizing...plain and simple...it's good that others than truly see the other side of the "trustworthy" Bill Cheek.

tsmith@ici.net (Tim Smith) writes:

BC>Bottom line is that you have an axe to grind and we're going to
BC>get to the bottom of it. I can't imagine what, but your lack of
BC>candor and vicious attack is more than provocative.

TS> But doesn't your reation to my lack of candor tell the populas
somethhing?

It should scream I am not afraid to deal
with your allegations up front, in public.
When a person has something to hide, he really
doesn't want it laundered in public, now does he?

Kind of like how you don't want to discuss
this on the public forum anymore. You're a
sleazeball liar and it is probable that I
can prove it with facts if we deal in public
where you spewed the venomous lies.

TS> Most personalities would simply ignore an alegation
TS> if there were no truth...

Would they now? Have you ever wondered why there are
so few or no "personalities" live and up front on the
radio newsgroups? Do people lie about them, too?
No wonder they're not present.

And it depends on the allegation. If you spouted
that I knew nothing about scanners, that would be
laughable and ignorable. To accuse me of plagiarizing
in general, is in-between. Maybe good for a chuckle
and a retort. To accuse me of plagiarizing Bob Parnass'
work is utterly despicable; not funny; and not ignorable.

Furthermore, your lying casts a pall over Mr. Parnass, too.
You see, questions immediately arise out of your mindless
thoughtlessness:

"Does your allegation that I plagiarized Mr. Parnass'
work come from YOU, or does it come from HIM?" "Did you
hear something from HIM on this note?" "Is HE saying
I plagiarized his work?" If HE said it, then I need
to deal with HIM.

Plagiarizing is WRONG. If a wrong has been done, then
it needs to be made right somehow. I don't know what
needs to be made right until it is established that
you're lying or telling the truth. You can't possibly
be telling the TRUTH unless you heard it from Mr. Parnass.

If so, I need to deal with *him*; not you.

Yet, in my good conscience and knowledge, I have not
plagiarized any works of others, and it is a gut-shot
that you blew Moss's trumpet. This matter now needs a
resolution.

When a lying sonofabitch steps over that fine line
between harmless and harmful, all bets are off. Your
spew is designed to cause me harm and loss. I am not
playing to the crowd, Smith. I am taking to YOU. But
you spewed your venom in public; we will resolve it there.

I am just a dude, Smith. I have a life, a livelihood,
and a family, all of which are within the target of your
vile, nasty lies. You went for my juglar; the kill.

Pardon me if I counter....not with lies, but with truth.
And I will deal with it until the matter is resolved.

In public.

SL> Stephen

I own an IC-R1 and it is a good scanner (despite the usual flames that will probably follow). There are two models being shipped right now. One (the govt issued one receives all frequencies from 1-1.3 ghz. The public model has cellular (and maybe more by now) blocked out. If you want one, keep your eye on this newsgroup. There is always someone posting about one being for sale with tons of stuff for a few hundred. I paid 400 and have seen it for more and less. someone advertised not too long ago for 250 bucks and that's
a really great price. If you can get it that cheap, I'd say pick it up.

I have a pro43 and have switched to Nicad AA rechargeable batteries and find they
dont last very long. I've even switched to a different brand of Nicads and still the
operation
after a full charge (15-18 hrs) is very short (about 4-6 hours?). I'm using the same type
of
nicads in a different radio and these last much longer (several days of similar
intermittant use)
before requiring a charge. has anyone else had the same problem? I've checked the
charger..it
seems to be fine. The Pro43 does seem to last a bit longer on Alkaline AA's but still not
as long
as my other radio (Icom 24AT).

Actually, this frequency is so close to the 2 meter amateur radio
band that a 2 meter Yagi should work well for it. You can pick up
used 11 element (a common length) 2 meter beams at hamfests for
in the $10-$30 (US$) range.

[Notes: This is a reprint of an article published in the March 1986 issue of Monitoring Times. This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

Owner's Report: Uniden/Bearcat 800XLT Scanner

Copyright 1986 by Bob Parnass, AJ9S

Manufactured in Taiwan, the 800XLT is the first programmable Uniden/Bearcat scanner to cover a portion of the 800 MHz band. Covering 40 channels in 2 banks the 800XLT is specified to receive in the following ranges:

Table 1. 800XLT Frequency Coverage

29 - 54 fm
118 - 135.975 am
136 - 174 fm
406 - 512 fm
806 - 912 fm

Only a portion of the new 902-928 MHz ham band is covered.

Differs From Past Models

There are several differences between this scanner and its Bearcat predecessors.

- There is only a single scan/search speed: fast!

- 800XLT channel banks contain 20 channels, not 10 as in previous models. Although we should be thankful for the inclusion of a channel bank feature, doubling the number of channels in a bank is a step backwards.

- Scan delay, channel lockout, and priority enable are indicated by separate, colored LEDs rather than the numeric display, making a colorful light show.

- Both the selectable scan delay and the priority sampling period are 3 seconds vs. 2 seconds in the older scanners. Although a matter of personal preference, I like the 3 second scan delay, but would

opt for a 1 or 2 second priority sampling period.

- Despite claims on the 800XLT box to the contrary, a 2 digit channel counter is displayed while scanning, as in the BC350, rather than "rolling zeroes" of the BC210/220/250/300. This is unfortunate, as rolling zeroes make it easier to discern what channels are locked out from scanning without having to step through each one manually.

- The keyboard has a good feel, although quite different from the "chicklet" keyboards on Bearcat 250 and 300 scanners. Keys travel further, with less of a positive click. The 800XLT keyboard is much easier to read, as each key has its function printed right on the keytop, rather than labeled above it on an inlay.

- The 800XLT seems to lack "window detection" circuitry, so the scanner may stop prematurely (off frequency) in the SEARCH mode.

- There is no date of manufacture stamped on the cabinet.

- Mobile DC power cord is optional, but is supplied as standard equipment with other Bearcat scanners.

Inside Appearance Pleasing

The inside of the 800XLT consists of 3 circuit boards:

1. a main receiver board, containing vhf/uhf front ends, IF stages, audio amplifier,

2. a feature board, containing microprocessor and keyboard logic, and

3. an 800 MHz front end board, which uses surface mount components.

The boards appear very neat, and it is obvious that computer aided design and automated component insertion techniques were used. What a welcome change from the chaos inside a hand assembled BC250!

No schematic diagram is furnished. Whereas the identity of many of the ICs in earlier Bearcat scanners was obscured by the use of "house numbers", the ICs in my 800XLT are clearly marked with their original designations (e.g. National LM382). This makes repair easier, as one may obtain parts from several sources rather than being forced to buy from Uniden.

Side-by-Side Performance Comparison

Side-by-side tests were performed, switching a Butternut SC3000 tri-band antenna at 20 feet among 3 scanners: the 800XLT, a new Bearcat 260, and an old Bearcat 300 workhorse. The test equipment used was a pair of human ears, which we all use when scanning.

As the following table shows, the 800XLT was more sensitive on some frequencies, but suffered much more overload from strong signals. This is important if the 800XLT will be used with an outdoor antenna. The 800XLT had fewer annoying birdies than the other models tested.

Table 2. Performance of Bearcat 800XLT vs. 260 vs. 300

Band	Bearcat 800XLT	Bearcat 260	Bearcat 300
30-37 MHz	more sensitive weak birdies overloaded by paging, police mobile phones	more sensitive moderate birdies no overload detected	less sensitive moderate birdies no overload detected
37-50 MHz	equally sensitive overloaded by paging, police mobile phones	equally sensitive no overload detected	equally sensitive no overload detected
vhf aircraft	more sensitive	N/A	less sensitive
vhf-hi	slightly more sensitive overloaded by paging heard 162.55 wx on 147.19 and elsewhere	slightly more sensitive no overload detected	slightly less sensitive no overload detected
uhf	more sensitive overloaded by paging	less sensitive no overload detected	less sensitive no overload detected

|_____|_____|_____|_____|

On the 800 MHz band, several police, business and cellular telephone stations were received using the supplied 3" antenna. Clear reception of a repeater used to dispatch Chicago Tribune photographers was possible from 50 miles distant.

The 800XLT audio output is clean and strong, with little synthesizer whine.

Early Problem Fixed: Memory Loss

My 800XLT lost its memory contents when unplugged from 117VAC, even though loaded with a fresh pair of alkaline AA batteries. The problem was traced to a metal contact, installed backwards in the battery holder. Repair required desoldering a red wire, repositioning the contact, then resoldering the wire. No further memory problems have been encountered.

Too Much Hysteresis in Squelch

There is too much "free play" in the stock 800XLT squelch control, the same affliction designed into Radio Shack scanners. The remedy consists of replacing the 860K ohm resistor on pin 14 of the MC3359P IC with a 2.2M ohm resistor.

Not As Selective as Older Bearcats

At -55 dB @ +- 25 KHz, the 800XLT IF selectivity is not as good as the BC350 and BC300, which are rated at -60 dB @ +- 25 KHz. The wider selectivity causes the scanner to stop prematurely in the SEARCH mode, and makes it difficult to determine, for example, if a station is transmitting on 855.0250 as opposed to 855.0125 MHz.

Since the 800XLT tunes in 12.5 KHz steps on the 800 MHz band, the wider selectivity is handy when scanning telephone cell sites, which are on channels spaced on 30 KHz apart.

Overall Evaluation

The 800XLT is the most conventional and easiest to operate of the new 800 MHz-capable scanners. It is plagued neither with the slow scan/search rate of the Regency MX7000, the low audio output of the MX4000, nor the unfriendliness of the Yaesu scanning algorithms.

The 800XLT's tendency to overload on strong signals and awkward squelch action detract from an otherwise good performance.

[Notes: This is a reprint of an article published in the February 1984 issue of the RCMA Newsletter, Technical Column. This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

Improving the Radio Shack PRO-24 Pocket Scanner

Copyright 1983 by Bob Parnass, AJ9S

Abstract

This article briefly summarizes my experiences with the new Radio Shack PRO-24 pocket scanner, priced at $99.95. Problems encountered include:

o irregularity in plastic belt clip

o misalignment of UHF stages as received from dealer

o design deficiency in squelch circuit

o incompatibility of recommended AC adapter accessory

Cures for these ills, as well as a modification to increase the scanning rate are covered.

PRO-24 Improvements

Powered by 4 AA penlight cells, this is a 4 channel, crystal controlled receiver which covers the following bands:

o 30 - 50 mHz. (VHF Low)

o 144 - 174 mHz. (VHF High)

o 450 - 512 mHz. (UHF)

Included with the scanner are tri-band helical and telescoping antennas, a plastic belt clip, and an owner's manual (with schematic).

The outward appearance of this Japanese made scanner is identical to previous Radio Shack models (PRO-20A and PRO-21A) which covered only two bands. The circuitry is similar to other Radio Shack and Montgomery Wards models in

that the same multi function MC3357P (2nd local osc., mixer, if amp, detector, and squelch) and T3375 selector chips are used. The audio amplification in the PRO-24 is performed by an LM386 chip, whereas pocket scanners in the past have implemented this function through the use of discrete transistor circuitry.

The PRO-24 uses a plastic belt clip, whereas previous scanners of the same ilk have used metal. The 2 holes in both types of clips are the same size and line up, so if the plastic clip breaks, it may be possible to order the metal one for an older model from your local Radio Shack store. The plastic belt clip and two screws are furnished in a plastic bag. If the owner wants to install the belt clip, she may find that one of the holes is a bit too small. Do not force the screw in, the brittle plastic may crack! Instead, enlarge the hole slightly.

I installed 1 UHF and 3 VHF High crystals. I had no way to accurately measure the sensitivity or selectivity due the unavailability of calibrated signal generating equipment. The sensitivity on VHF High seemed fairly respectable, considering the tri-band helical antenna. Sensitivity on VHF Low could not be determined due to a lack of a suitable crystal in my collection.

UHF sensitivity was dismal. In particular, the local police repeater on 470.3125 mHz, could not be received in many parts of town. I realigned the RF amplifier and mixer stages in the UHF circuitry, which improved UHF sensitivity noticeably. However, the UHF sensitivity still seems a disappointment. In the PRO-24, the front end stages for the 3 bands are all connected together at the antenna. As an experiment, I disconnected the VHF Low front end from the antenna, thinking that the direct coupling of this stage was loading the others down. I again realigned the UHF stages, but could detect no improvement in sensitivity.

The squelch control had an inordinately high amount of hysteresis, resembling "play" in a car steering wheel. This forced me to keep the squelch up at a point which prevented reception of signals of weak to moderate strength. As mentioned previously, the squelch function is performed by a common Motorola chip, which has been used successfully in several previous scanners. An inspection of the schematic diagram, provided in the owner's manual, revealed that for some reason, a low value of resistance (33,000 ohms) was used for R35, which was placed between the squelch output and the noise amplifier input (IC1, pins 14 and 12). This "feedback" resistor was much smaller than the 220,000 ohm resistors used in previous designs. After

changing the resistor in my PRO-24 to 220,000 ohms, the amount of hysteresis decreased markedly, and the squelch worked great.

Both the owner's manual and Radio Shack catalog recommend the model 20-189 AC power adapter/charger accessory ($6.95) for use with the PRO-24. This adapter may be used in two ways:

o If plugged into the AC adapter jack on the scanner, the scanner's batteries are disconnected, and the radio is powered from the AC line.

o If plugged into the charger jack on the scanner, the radio circuitry is completely disconnected, and the batteries are charged by the adapter through a current limiting 27 ohm resistor located inside the scanner.

These two jacks are of the coaxial type, and each contains a switch mechanism which is activated upon insertion of the proper size plug.

I bought the recommended accessory, and although it was labeled 20-189A, I was assured that it was indeed the proper adapter, and the 'A' meant that a new vendor was supplying these to Radio Shack. As a precautionary measure, I made a quick check with my Fluke DMM. This revealed a problem: when the adapter was plugged into the scanner, the internal batteries were still connected!

This can cause two unwanted effects:

o If I used the adapter to power the scanner, the batteries would be charging at an indeterminate rate.

o If I used the adapter plugged into the charging socket, the batteries would be placed directly across the 6 volt DC power supply (bypassing the current limiting resistor!) and would indeed enjoy a short life.

The culprit was the connector on the end of the adapter. The outer diameter was just a bit to small to actuate the switches in the scanner's jacks.

My problem was solved by buying the Radio Shack 6VDC 150 ma. AC adapter (273-1454, $5.95). In addition to having the proper connector, this adapter works well, is cheaper than the recommended one, and can furnish almost twice the current!

The specifications in the owner's manual state that the scanning speed is 6 channels/second, a bit too slow for my liking. I added another 220,000 ohm resistor in parallel

with R64. This changed the time constant of the scanning oscillator, increasing the scanning rate.

When fully squelched, a good portion of the battery drain can be attributed to the light emitting diode channel indicators. When the "manual/scan" switch is in the "man" position, my unit draws approximately 27 ma. from the batteries. Following up on a suggestion from Ed Doubek, N9RF, I always leave the PRO-24 in "scan" mode. When I want to listen to just one particular channel, I just lock out the others. This causes a single LED to blink on and off at about a 25% duty cycle, thus conserving battery life.

I bought this scanner at a reduced price, and in summary, after a several hours work, it performed at a level close to my expectations.

: the frequencies that the flight for life helicopters use (both the pilot
: and the med. staff to the hospital). I am specifically interested in the
: frequencies used in the Houston area.

: Thanks,

: Dave

There is probably a "home" frequency for the unit. Maybe someone has it.
Try also the "mercy" channels (155.340 and 155.400) for inflight use.
Don't forget the 463 Mhz paramedic freqs listed in "Police Call Radio
Guide." Air freqs that might be used are 123.025 (helicopter air/air),
123.05 and 123.075 (Unicom at heliports).

Herman Hospital "Life Flite" heliport freq is listed as 123.05 as is
Methodist Hospital.

I got a look inside and chatted with the pilot of the Loyola University
med chopper at Meigs Field in Chicago one summer. Their radio is
programmable to communicate with any municipality that they might have to
assist. That may be the case within your area. So you might also hear them
on a mutual aid police or fire freq at the location of an incident.

>when a Mod says to remove a diode ...How do i do this?

For a standard leaded part (one with wire leads):

You can either cut one of the wire leads of the part to electrically
"remove" it from the circuit, cut both leads to remove it from the board
altogether, or use a soldering iron for the same purpose.

If it is a surface mount part, you can either crush it and remove the pieces,
or carfully unsolder it from the board.

If these descriptions don't do it for you, then you shouldn't be inside
your scanner because you aren't ready or qualified! (IMHEO)

I just received my latest DAMARK mail-order catalog and noticed that they have the Uniden BC-350A/450A scanners for $79.99. Since I've been wanting a scanner for awhile, this seems like a good chance.

What I'm wondering is:

1. What are the real capabilities of this receiver? In true marketing style, the ad tells little other than 50-channel, 11-band, and 100-channel-per-second scan rate. Anyone know what the actual frequency coverage is, and how well these radios perform?

2. Is this an easily modifiable scanner for increased performance? What mods are available?

3. Is $79.99 a good price? The units are advertised as "factory recon-ditioned", with mounting bracket, AC adaptor, telescopic antenna, DC power cord, and cigarette-lighter adaptor. Since I'm ordering from out-of-state, there will be no tax and DAMARK has free shipping.

All help appreciated,

Martin Jones

I had an R1 for a while. While they claim it covers this expansive range, it does so with relatively
poor performance. For example, while tuned to 460.375, the squelch will open and you can hear
faint audio from 460.325. When I tried to tune in WWV/WWVH on 15 MHz during the daytime, if I used an antenna with better performance than the rubber ducky, the receiver would overload.

That's hardly acceptable performance given what else is out there today, such as the AOR's.

Groovy! how about a scanner that has:

1) Full frequency coverage from 30MHz to 2GHz
2) All mode, user selectable am/fm-wide&narrow/LSB-USB/CW/Pulse
3) Complete computer-control interface w/software
4) Built with garden-variety components, so it can be easily serviced
5) A complete front-panel, using a low-cost display. Smeter and center-tune indicators.
6) I.F. outputs at both 10.7MHz and 455KHz so the unit can be used to drive a spectrum analyzer/pan adapter, etc.
7) a builtin modem so that all firmware can be updated via a BBS connection. Or provide for FLASHPROM updates to be possible via the computer interface.
8) Published listings for all internal software.
9) 1024 memories. Each capable of holding frequency, mode, decoded infor and a time/date.
10) A fully-metal case and subchassis, so the unit doesnt re-radiate.
11) A real on-off switch for the 110/220vac transformer, and a NEMA linecord.
12) The ability to run from 12VDC, and include a standard cigarette lighter cord and plug.
13) A telescopic antenna that has a base-swivel builtin and isnt cheap!
14) A mobile bracket system for quick detachment and removal from a vehicle.
15) An internal speaker that's at LEAST 4" in diameter.
16) DSP filters in the RF, IF and audio stages that can be computer or panel controlled.
17) An adaptive squelch that will optionally skip data-laiden carriers.
18) On-board DTMF and CTCSS decoding and display. w/logging via the computer interface.
19) Frequency search and logging, to on-board memory or via the the computer interface.
20) A user manual that was actually written by someone who speaks ENGLISH as their 1st language!

Now..if UNIDEN wants to make some REAL MONEY...might I suggest they build a 6m version of the ever-popular HR-2510 or the newer HR2600? Priced similarly, UNIDEN could expect to virtually corner the market on 6m Amateur transceivers! Are you guys listening??

It's not that I'm better than a lower class licensee it's just that I'm
sick of the whining that some no-coders issue forth with. If you're
happy with your license class and aren't whining for extra class
priveleges then I have no problem. But I made the effort and got
my extra class so why should anyone else be grandfathered in? Ask
KD1HZ about that.

A lot of us newer Hams have earned our Tickets from the no-code era.
Personally, I passed the 5WPM while waiting for my license and went on
to the Advanced "class"... which makes me no better then anyone who
hasn't. Many people don't have the time to do the preperation needed
for the higher class requirements because of family, jobs, etc.

I got my start in CB many years ago, moved into SWL and learned a lot
about propagation and such, then did the Ham thing. I understand that
in the more densly populated areas, 2M is becomming more "CB" like.
On the other hand, many areas of 80, 40 and 20 meters are the same way
because there are people who have been there for many years and
believe they own their particular slice of the frequency spectrum.
These may be the same people who complain about no coders.

I have talked to many people who state they are "...just a No-coder",
So What!, they earned it just as I earned my advanced. More power to
'em. If they want to advance and gain more privledges, they will! If
they don't, that's their choice in a free country.

There are Butt Heads on 2, 10, 11, 12, 15, 17, 20, 30, 40, 80, and
160 Meters... who cares, do what you want and don't bother your
"Brother" about his/her choices.

>you as absurd? It should, and is as insulting as your statement.)

Oh, if we had just done this 25 years ago. Back then we had a tight
little operation on VHF FM with its own crisp procedures taken mostly
from public safety. But the HF, appliance-operating, code-sending,
ARRL-supporting scumbags: (a) decided that there was something to FM
after all and, (b) found they didn't have to be professional-level
land-mobile radio technicians to put something on the air (due to the
burgeoning importation of rice-burning radios from Yaecomwood). Since
these assholes had "real" licenses, they couldn't be taught a thing.
And their sheer numbers overwhelmed any attempt to limit their access
to the good systems and thereby maintain high standards. Now, we have
reaped the bitter fruit of the vulgarization of the mode - long-winded
transmissions that routinely timeout the machine, grossly inappropriate
and horribly ineffective operating procedures, total cluelessness
concerning system and unit technology ("SINAD???") and an overwhelming
arrogance toward long-time, highly competent system operators. The
situation is hopeless now. But, if we had just been diligent back then
and kept anyone with a loading coil on his car off of FM, we could
still be enjoying evenings monitoring the local repeater in peace and
quiet.

KC>Looking for a Icom R7100
KC>If you have one I need one

KC>Pay cash must work good

Because of new employment obligations, I am no longer using my R7100, so I'm selling it and the other following items for a package price of $1590. I want to point out that this is no ordinary R-7100. The following mods have been performed on this radio.

* The Deltacom computer interface has been internally installed in the radio with a 9-pin serial socket on the rear panel. All you need for computer operation is a serial cable and software (please note that both the Deltacom and ScanStar Commercial software is included).

* 12VDC coaxial input has been added to the rear panel, thus facilitating easier connection in mobile applications.

* Scan/Search speed up. The crystal has been replaced, resulting in greatly improved performance.

ICOM R7100 (unblocked 800 MHz) - Current price is $1688.

Includes original box, all manuals, AC cord, DC cigarette lighter plug.

MB-23 R7100 Carrying handle - Current price is $11

UT-36 R7100 Voice Synthesizer - Current price is $54

Deltacom computer interface - Current price is $349

Registered ScanStar Commercial - Current price is $129

If purchased new this package would cost over $2000. Please E-Mail if interested to 73477.3426@compuserv.com.

I would agree with Rick. If there are diagrams and schematics
it's worth getting the magazine.

It's actually easy - I just did it. I called the number above
and they took my name & addr. $2.50 for the mag, plus postage, and
it goes first-class to your doorstep. I put it on my VISA.

Mike

I have not been keeping tabs on the U/VHF Scanner scene for quite some time. I once had a Radio Shack scanner a few years ago but I sold that not too long ago. However, I am interested in getting back into the hobbie.

I am interested in purchasing a hand-held unit as opposed to a desk top model that covers the range from, say, 25 or 30 MHz to 1300 MHz with NO BREAKS! Of course, I would like to get one with all of the bells and whistles for the coded police broadcasts.

If anyone has any advice as to which models I should look at or what magazines, etc. I should look at I would greatly appreciate it.

Also, if there are frequency lists out there for Ontario please let me know.

Thanks in advance!

Boy, some folks sure like to stereotype us extra class hams. They must have had a bad experience with some aspect of ham radio. Granted, there ARE those overzelous hams out there that eat, drink, sleep, and breath ham radio, but not all are like that. Just because I can send and receive 35 wpm cw doesnt mean Im a better person than anyone else. I think the reasons that most hams give for wanting to keep the cw test to be on the ham bands is not accurate. Personally, I like cw and think it should be kept for two resons. 1> It inspires an extra effort, gives a more accomplished feeling when one gets their license, gives one a better sense of responsibility that comes with being able to communicate with others by voice world wide, although that seems to be going by the wayside with telephones and the internet. It boils down to a sense of self accomplishment. 2> Its VERY traditional. Ham radio is special to most, not just what you can do with it but special in its sense of history and service. MANY groups hold tradition very dear, the Masons, Knights of Columbus, ethnic groups such as African-Americans, Native Americans, everyone has some sort of tradition that they like to adhear to. When one partakes of the ham code test, they are saying "I understand the tradition of amateur radio and I want to be a part of this tradition." Its a matter of choice as I see it. Not to mention that it IS a requirement WORLDWIDE as dictated by the ITU. If someone just wants to use radios to talk to their buddies, and dont want to take any tests, there is a much easier way to do that, its called GMRS. Just plop down your bucks for the radio, and a small license fee for the fcc, and youre all set. But if you like radio experimentation, chasing a weak, watery sounding signal comming across the north pole late at night from who knows where, want to work satellite communications, or even MIR or the space shuttle, then I would suggest taking the time, putting forth the effort to study for the ham exam and then feel the reward of all of these things and more. Bashing ham radio and extra class hams just because of a bad experience doesnt solve anything. There are jerks everywhere, even in this newsgroup. Stereotyping gets nobody noplace. 73. B.

Greetings all.....here is a repost of a review of Bill Cheeks 'World Scanner Report'.
I found it on several ftp sites. I think its a fair and accurate appraisal of the newsletter. I dont know who the author is or where it was originally printed.
I pass it along for your information.

****

Hi fellow scanner people!

I've just finished reading my very first World Scanner Report and I am so exited I just have to tell you all about it! This periodical (if you could call it that) is put out by none other than Bill Cheek (aka Butt Cheek). My copy of the June 23rd, 1995 one was forwarded to me by a disgruntled subscriber. Apparently this reader thought the entire thing was of rather dubious value and fished it out of file 13 thinking that I might benefit from it.

The "WSR" is five 8.5 x 11.0 black and white pages, stapled, folded, taped and stamped - no envelope. (Cleverly engineered for the rock-bottom cost of 32 cents for postage and about 8 cents for the paper and ink). But look, on the very first page it says a single issue costs $5!! But wait, if you live in Canada that $5 becomes $5.50. I'm not American, but I'm quite confident that a letter to Canada, from the USA, does NOT require special handling nor does it cost an ADDITIONAL 50 cents to mail. I suspect it's closer to 20 cents more so what gives?

Well, if I had $5.50 to spend on a communications journal I *think* I might be persuaded to try The Monitoring Times or Popular Communications instead - especially considering they are less expensive and have considerably more pages etc. But that is a personal decision, of course.

Okay, let's have a look at the contents of "WSR"!

"New Scanner on Scene?"

Tony Papson writes a message to Cheek on his pay-for-play BBS (as evidenced by the advertising cleverly included at the bottom of the message) telling Cheek of the new Realistic PRO-26 Scanner. Cheek says he knows next to nothing about the unit. I'm dis- appointed! The epicentre of Scanner-knowledge knows nil about a new product? How *strange* that Tandy Corporation didn't ask Cheek to *review* the new unit - much like car companies do for Road & Track etc. Oh well!

"Brass Tacks & Steel Lugnuts"

Cheek goes into a diatribe that essentially says that his new customers are out to rip him off! He is trying to justify the increase in cost of this "mailing" to the readership. He drops the name of *another* newsletter he used to put out, "Eleven Meter Times & Journal". (Bill doesn't play with CB radios any more and I'd bet dollars to doughnuts he doesn't want you to know why either.) Remarkably, his whining continues on and covers almost ALL of the following page!

"More on the Pro-26/60"

Larry Fowkes expands on the PRO-60 scanner and does a nice little article juxtaposing it with a PRO-43. He essentially "reviewed" the scanner for Cheek and the readership. Cheek adds his two cents in only after Larry has to FAX Cheek the service manual. (This seems to fly in the face of Cheek's earlier dissertations on the evils of copyright infringement!) Cheek recognizes that the circuit of the '60 is different from the '43 but is unable to deduce anything from it. He also doesn't know if "...an S-meter is possible for the PRO-60 like the PRO-43" and then goes on to say that next to a receiver, an S-meter is the most important thing. Uhuh.....

"The Other View" - by Janet Cravens.

Wait, that name sounds very familiar! YES! Janet Cravens is the wife of Roger Cravens of Fidonet infamy!!! The article is a nicely written anecdote of a wife's perspective on her husbands hobby. If you read the parts about Janet & Roger having dinner with their vicar and THEN read some of the posts from Roger on Fidonet you would be hard pressed to believe it's the same person! Janet tells of how she has learned from Roger that a TV antenna makes a poor scanner antenna. This is interesting because Roger sent me a message once telling me to read some obscure, forty year old IEEE papers to back up his AND Cheek's claims that a TV antenna has gain at 25Mhz! In all fairness, Roger does post some useful things on the Fidonet. He is also known to post right-wing propaganda of some perceived govern- ment conspiracy and doesn't miss an opportunity to take a jab at politically left-of-center types. Routinely Roger will cross-post long-winded messages from other networks without the express perm- ission of the original poster and with a flagrant disregard for the originating networks rules. Roger left Fidonet in a blaze of glory a couple of months ago. Swearing never to return (and swearing while he said it!). He was back only two or three weeks later "educating" me about antennas. Quite remarkable when you read in his wife's article, "I've learned to be quiet while he (Roger) studies to take his tests for his ham radio license." Just to put things into perspective, I have the top license class in Amateur Radio and have been "on the air" for ten years. I am also a professional in the two-way communication business.

"New Contest Announced"

Bill Cheek is looking for "what pisses you of in radio" with anonymity assured. This seems like a *very* strange request to be sure. The best stories, as judged by Cheek and his wife, win a CD of the FCC frequency database. I wonder if the software sup- pliers are aware that their products are being awarded to people who are bad-mouthing their

core-business? I guess if Cheek purchased the discs from PerCon Corp he can do whatever he wants with them - I suspect this was not the case though. Cheek says, "Contest are kind of fun...". However, I can't see how anything fun or positive can come out of this.

"Error Advisory"

Cheek apologises for a blatant error in a VERY simple circuit he published previously. On a lesser note, Cheek's schematic does not adhere to industry standard conventions and it appears like he is trying to "copyright" paralleling three SPST switches with three that are already in the radio. Remarkably, this takes up half the page!

"From the Readers"

Melvin Morris writes that he has ordered Cheek's book, "The Ultimate Scanner", for the "simple layman terms" and "the humor". If it's anything like this World Scanner Report, it's a joke alright.

"SCA Decoders"

Cheek takes the liberty of publishing a schematic of Ramses' SCA decoder to fill a large part of the page.

"PRO-2027 Cellular"

Cheek says he's never seen a "PRO-2027" scanner. Despite this, he goes on to say that his "attentions are directed mostly to the *better* scanners...". Hmmm......that's tantamount to saying, "I've never seen a Packard but my Rambler is better".

"PRO-2021 Computer Interface"

A very flattering letter from Edward Smith with a question about his PRO-2021 scanner. Cheek responds by saying that he doesn't own a PRO-2021. Boy, if this WSR is anything to go by, Cheek sure doesn't seem to own very many scanners! Cheek then mentions that he's disinterested in helping out this fellow. However, Cheek says his wife Cindy would be more than happy to take his money for one of his "CE-232" kits. Also, by his own admission, he says that the performance of it would be restricted and it would have to be "debugged" *IF* it were to work at all!

"Hacking Techniques"

Cheek describes how to use his "CE232" kit with a previously modified PRO-2004 scanner. This involves using something in the software of the CE232 that he calls "...an undocumented feature". It sounds like it *should* have been documented from the very beginning to me.

"Antenna Comparisons"

A nameless WSR readers asks why Cheek recommended the Antron PSM over the Radio Shack mobile scanner antenna? The reader has both of them and found them to perform identically. Cheek apparently promised a controlled test of them but hasn't come through. He claims that he's been busy but eludes

to the possibility of, "maybe this summer?". A couple of things come to mind here. Does Cheek even *have* these antennas? How does he plan on testing them? What equipment does he have on his test range or in his anechoic chamber? Why would he be recommending one antenna over the other before comparing the performance of each?

"PRO-2004 EL Panels"

Robert Anderson writes that electro luminescence panels for the PRO-2004 are still available ordered through Radio Shack stores for $60.34. Cheek suggests that the reader might have been taken to the cleaners. He then lists Tandy's toll-free parts number. A better idea might have been for Cheek to actually CALL the FREE number and find out for his readers what they should be paying.

"SCA Decoder"

Cheek refers readers to back issues of WSR to find out what an "SCA" decoder is. He then does it two more times and also makes reference to it being explained in his book. It would have been just as easy to explain it the WSR again for those that didn't know.

"Computer Talk"

Cheek tells his readers that he would recommend Windows95 and 8MB of RAM. Just ten minutes ago Bill Gates was on TV saying that 16MB would be recommended for Windows95! Also, I have one friend who recommends Unix, another who recommends OS/2 and a third who recommends the new Mac PowerPC. Who should I believe??!?! Cheek then takes a swipe at a reader's computer (a Packard Bell) and then says that "Dell" are always a great buy. Gee, I *wonder* what ki�d of computer Chee owns? Cheek doesn't mention anything about local bus, VESA, SCSI or monitors etc. I would guess because he simply doesn't know anything about them. He recommends a "bus" mouse over a serial mouse "because it's much better" and "to keep one of your COM ports open". I can remember wrestling with a friend's machine that had a bus mouse. The bus mouse was clashing with other hardware in his machine. It used an additional card in one of his ports/slots on the machine. The card/driver for the mouse "faked" a COM port so that the mouse "appeared" as a serial one to the software. I'm trying to imagine why this would be superior to a serial mouse and also why a first-time buyer would find it so? Cheek also mentions that you MUST have 16550 UARTs in your machine. He doesn't mention that they are more expensive and are of zero consequence if you don't have peripherals that demand the higher serial speed. For instance, if you had an internal high-speed modem they would be essentially useless. I went to a high-speed modem (external) on my computer so I purchased one 16550 chip and replaced the socketed 16450 that was already in my card. I'm sure that I paid less money than if I had have originally purchased the 16550 when I bought the machine new.

"WSR Contest Winners"

These are the "winners" of an apparent "contest" in a previous issue of WSR. This was NOT a contest at all. There is absolutely NO mention of prizes. This "contest" was entirely an ego-trip by Cheek to point out an oversight made by Larry Miller on page 28 of the National Scanning Report of March/April. It serves no useful purpose to any of the readership.

"Other Products"

Amusingly enough, the CE232 "kit" costs $194.95 (plus 5$ for shipping & handling). That's $200. Do yourself a favor and compare the CE232 to the Optoelectronic 456. A comparison of the two is laughable. They don't compare at all. The Opto is a profoundly better unit and the argument that Cheek has about it not being able to auto-programme is totally moot.

"Audio PA for 2004,5,6 Explained"

Not a bad explanation of the circuit. (BTW Cheek, C223 is for compensation). But, the suggestions for modifying the "beep" tone are really lame. I can immediately see a better way on the (badly faxed to Cheek) schematic that would have the beep volume track with the radio volume. I can also see a way that would improve the audio quality and reduce the distortion of the output at high volumes. Of lesser importance I can see an easy way to add a tone control or some very sharp (and possibly useful) filtering. But Cheek says, "...the audio power amp is better off just understood. No interesting hacks here to speak of." !!

I don't know what was used to create (well, okay copy) this part of the schematic but I would personally recommend OrCAd SDT 386+. It's a programme used by professionals in the electronics business. I use it all the time.

"Back Issues"

The pricing here is very interesting. The older "WSR" from 1991 will cost you 20$ for 10 issues. The 1994 will cost you 25$ for 10. Given the look of this five-sheet piece of journalism, I would say that it was printed in it's entirety using one of the popular Windows desktop packages. In other words, Cheek will NEVER run out of back-issues as he can easily print more! Plenty of references are made in the WSR to previous issues to bait new subscribers into ordering them. The only reason I can think that the older ones are cheaper is perhaps if they have fewer pages and would cost a few CENTS less to mail!

NOTE: This message is in no way copyright protected. Please feel free to distribute it in part or it's entirety, with or without credit, in other networks; groups; washrooms; magazines; tradepapers; newsletters; almanacs; school yearbooks; etc. etc.

BearTracker800 BCT7

*** Allow the Alert Monitor to work when scanning the CB channels.
Or, better yet, add CB to the "HIGHWAY" button (ie: HIGHWAY/CB")
and change the operation of the "HIGHWAY/CB" & "POL/DOT" buttons.

Example:
press "HIGHWAY/CB" once, scan Highway frequencies
press "HIGHWAY/CB" again, scan CB channels
press "HIGHWAY/CB" again, scan Highway & CB
press "HIGHWAY/CB" fourth time turns Highway/CB scan off

(likewise for the "POL/DOT" button)

Allow the ability to scan HIGHWAY/CB with POL/DOT simultanously in
any combination, with Highway Alert Monitor active.

*** For the Ultimate Tracker, integrate a remote Radar/Lazer
detector as an option. Perhaps using the BearTracker as a headend
unit for an Alert Light/Tone (different from the Highway Alert
light/tone although with similar programability) with an interface
on the rear of the BearTracker which accepts the input from the
Radar/Lazer detector.

*** Add a Weather Alert!

When the National Weather Service issues a warning tone on any one
of the weather channels, STOP all scanning and lock-on to the
weather channel. DO NOT use an alert tone or alert light. Be able
to continue the original scanning by pressing the "HOLD/RESUME"
button.

*** Expand the VHF Low Band to 30.0 - 54.0, Radio Amateurs would
appreciate that :-)

*** And, while I,m at it, lets get the Communications Privacy Act
recinded. It was fine before the cellular/cordless ban!

Gary,

I can hear them now that I've adjusted my squelch properly. I live on the
east side of WA, and my reception is awful. Much worse than they used to be.
I suspect the antenna that came with my Bearcat 860xlt. It just doesn't seem
like a good antenna. OTOH I get Greenfield prefectly.

Take a look at AOR 3000A and AOR 5000, add a CTCSS board for BOTH tone PL and digital PL. Have high sensitivity without jeopardizing selectivity/rejection (good quality filters). Keep channel banks down to a reasonable number, 20 not 100. Add a channel selectable tape record switch ala Bearcat 250. Triple up conversion. User selectable tuning and search increments. Keep chassis small and price under $500. Amenities to aid in trunk scanning (GE trunk tone detect, for example). Continuous 100 Hz to 2000 MHz, NO GAPS. A nice display that doesn't fade or tend to burn out over time.

I'll buy two.

998. Need San Jose Area Frequencies

I just acquired an old Midland scanner which uses crystals, and am looking for the frequencies used by local (N. Calif) agencies such as San Jose Police & Fire Departments, and Campbell Police & Fire Departments. The local Radio Shack's will order any crystal I want but they do not have a list of who uses what frequency. They are out of the book called 'Police Call' which I am told has this info. Can anyone help?

>terms whenever you change bands. Granted, calling CQ on a 2 meter
>repeater seems unnecessary, but it shouldn't be considered an egregious
>offense on the calling frequency.

I don't think anyone would claim otherwise. CQ is a signal that has traditionally been used to attract attention in simplex operation, whether that operation is HF or VHF, where long winded call ups are required because there's no assurance anyone is listening to the particular frequency, but rather may be tuning the band looking for random calls. I believe many people only object to its use on repeaters, where it is redundant. Simply keying up and speaking your call sign is sufficient to alert all others monitoring the repeater to your presence and your willingness to talk. Anything more is excess, unnecessary, and a mark of poor operating procedure on a limited resource.

>One purpose of the Amateur Service is to provide a pool of trained
>operators. Why not train them in proper HF phone protocol while they are
>still on the VHF frequencies? Most folks learn by listening. They do
>what they hear others doing. Each operator also seems to have a little of
>his own personal style. This is a good thing I think.

I find this somewhat insulting, IE that you are saying that HF procedure is somehow "grownup" while VHF+ procedure is not. Many amateurs find VHF+ a perfectly satisfactory permanent home, and some have even migrated *from* HF to VHF+ since it better suits what they consider to be good operating fun and good operating practice. Perhaps we should teach good repeater etiquette to HF operators, so that when they finally graduate from frequencies near DC they'll know how to behave. (Does that strike you as absurd? It should, and is as insulting as your statement.)

>What's appropriate on 20 meter USB should not be considered inappropriate
>on VHF. A little greater tolerance by some would also be nice. Probably
>the most inappropriate kind of protocol is to key up a say something like
>"we don't say 'over' on this here repeater". People will learn by
>example, and rudeness is not a particularly desirable quality to teach
>to new amateur operators.

I agree that rudeness is never desirable, however, I also think that
use of 20 meter HF procedures on VHF+ repeaters is rude, and a mark
of ignorance on the part of the operator. The characteristics of HF
and VHF+ repeater operating *are* different, and different procedures
should be used. The techniques of the DX pileup or roundtable are not
the proper ones for VHF+ repeater operation. It's a different kind of
communications channel, and requires different procedures for optimum
utilization.

Tim, I have a BC3000xlt and I can promise U it is worth every cent U
pay!!!
Intermod is not a problem and U can pick up "certain" 800Mhz Freqs.
in the 1005-1030Mhz range!! Ok, so you get images instead of the real
freqs. but it works!! The nicad battery seems to last forever, and the
banks
are divided up great.(20 banks, 20 channels each.) Let me know if you get
one, there are "hidden" keypress codes to help 800Mhz trunked system
scanning. I will E-mail U with them.
73 and Happy Scanning!

From the FAQ:

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[...]

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel
portable with 20 banks. Up conversion. Very fast scan,
search, and intelligent Auto Store. Mode, attenuator, and
delay settings programmable for each channel. 50
frequencies can be locked out during search. Larger
speaker than PRO-26 produces better, crisper audio. See
"The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in
Monitoring Times, April 1995.

Note: Reprints of Monitoring Times articles are available
for $2.00 each from Grove Enterprises, PO Box 98,
Brasstown, NC 28902, tel. (800)438-8155.

Well, the Amateur Radio Handbook (from the ARRL, at most Ham stores) is pretty good. You may not need a "linear" amplifier - that is for AM and SSB signals. FM can use what is called a Class C (much more efficient) amplifier.

Good luck!

Okay here it goes.
A misinformation campaign launched by idiots that seek to alarm the public.
Example : ' Should the Internet county float a $45 million bond on improving our current 911 emergency system?" Most would votes yes.
They do not tell you this NEW system will prevent you from monitoring local goverment on your scanners. It something they forgot to tell you.
It is a Government by the people, for the people, (at least the last time I checked)
This radio system is paid for by YOUR MONEY (taxes) AND You must have access to listen to it.
Anyone that differs smacks of an ilitist (I can listen and you can't) should be taken away from their precious public safety job to see what they think then.
You MUST give members of the media the right to purchase at their expense their radios. Why? Public support will fall.
The cops & fire dept. are lazy . They don't do a damn thing. They tell us what they want to tell us.
Do you really think a PIO is going to tell the media "We fu**ed up, when the media would not have otherwise know about it?

> 10-4 ??

Yet ANOTHER "extra" class (and when I say class, I sure don't mean
that the idiot HAS any) with a freekin' ATTITUDE. The attitude that
because he has obtained his lofty licence (OH! Haaaaaail to the Mighty
Amatuer GOD!!) that he is somehow better than those of a "lesser"
licence.
Jeeeeezzz.... how many times have I seen that?? Enough to completly
spoil my desire to participate in Ham Radio (like I used to) and not
want to have anything to do with it.
Ya know... before I got my ticket, I was under the "delusion" that
Amatuer Radio operators were like a big "brotherhood". Yeah right....
It wasn't long after I got my licence that I realized what a HUGE "class
distintion" there is!! Blacks think they've been discriminated against by
whites?? They don't even KNOW what discrimination is! Let them try being
a "technician" class for awhile! I'll tell ya.... When you are "only" a
technician class.... to most advanced and extra class operators, you are
LESS that a smelly pile of dog-shit. You are scum,and that not only are you
just not ignored, but sought out for ridicule, and told that you don't really
even deserve to be on the radio!
And WHY do they think they're better?? Because they know some more radio
theroy, and can pound brass quicker than someone else. Well... big fucking
deal. If that is how someone mesures they're "worth" as a person, then as far
as I'm concerned they're pretty fucking worthless.
So all you Extras (and to a certian extent Advanced) class operators out
there... go ahead and post your stupid little posts...and complain, whine,
and bitch on 20 and 40 meters.... and sit on your big soft fat asses, and
bask in the "glory" of how much BETTER you are than the rest...
just think about all the others YOU have driven away with your ATTITUDES,
and wonder where all the hams have gone when the FCC is selling off your
precious frequencies!

I think the group has had enough of your public ramblings. My opinion still stands along with the developing opinion that the only reason you are here is to market your organization, sell books and subscriptions to your newsletter and contribute very little otherwise. It's your right and if anyone is remotely interested and has alot of idle time can reload the old articles and follow the threads.

Tim Smith - tsmith@ici.net - wrote:

BC>>I am not in the newsgroup for marketing. Radio is my hobby, too.

TS> Hmmm...you're becoming really incoherent....earlier your life,
TS> livlihood and family were at stake. No marketing?

Lying like you do......puts a lot at stake. What if I researched
and contacted your employer with........fabrications and lies like
you basically did to me? Got nothing to do with marketing, Smith.
It's lying.....between the gap in your buckteeth.

TS> Ok...we'll ignore the commercial, tag line, brag page or whatever
TS> you call it then...

Signature line? Filled with different ways to communicate with me,
which....by the way, a lot of people want to do. There's no
advertising in it. It's a helluva lot better than much of what I
see out and around. You don't like it or something? Does it
bother you? If so, check Parnass' signature line. Now there's some
advertising for you. No? I don't mind, but apparently you do.

TS> Good...you'll probably need them when sales dip even further....

What sales? Are you trying to hurt my sales? Suit yourself, but
you don't stand a chance. My bulk business is sales of oversize
condom rubbers for the overendowed. You couldn't possibly influence
my control of that market on a dream and a prayer.

If you want to stop me from writing books on radio hacking, well,
have at that, too. I can't imagine why, though, unless you are
downright jealous or too impotent to accomplish anything for yourself.

TS>...sure is strange how BP posted a few "familiar" articles today...

I've never read them, but will download them now for posterity.
I see where they are product reviews. I am not interested in
Parnass' product reviews whatsoever. Never have been. He does
things the way he sees fit, which is fine for the neophyte....
but of no use to me. Parnass addresses a wholly different audience
than I do, and ne'er the twain meet. It's no big deal, but I am
not interested in plagiarizing anything he has ever written.

If......and I say *if* he was the original author of that R71A
tuning technique, it was a total, random accident that I wrote
about it in the Montoring Times article of January, 1992. A fellow
in Las Vegas sent me the write up and GAVE ME PERMISSION TO PRINT

it. For all I knew, he was the originator. He still could be for all I know. Maybe he told somebody about it who told somebody about it who told Parnass? Maybe he picked up Parnass' article off the Internet? Maybe someone else rewrote Parnass' article and changed the credits? There is NO TELLING about that sort of thing.....

Now, are you ready for a bombshell? The article I printed differs substantially from the one Parnass posted to the echo. The title is the same...the substance is the same.....but the articles ARE different. Furthermore.....and clapse a deathgrip on your peanuts before you lose them, but Parnass' header states the article was from the April 1985,issue of Monitoring Times. What I wrote was for the January 1992 issue. Now isn't THAT weird on a couple of counts?

1) It would or should be painfully obvious that I would not knowingly "steal" something from the same magazine !!!!!!!

2) And it is mighty strange that Monitoring Times let it pass !!!

If this is the basis on which you levy your charge that I ripped off Parnass' stuff, then bend over, fella. There's nothing of substance to your bullshit. It was a compound accident over which I had the least amount of control. I'm not sure HOW I could have prevented it.

If you claim anything in my three books is Parnass' work, then get off your lying butt and spit it out so I can check into it. Don't get

your hopes up though, dingleberry. Everything in my books has been checked and doublechecked to make sure of sourcing and other potential conflicts. Clean slate there, parasite.

Forget Parnass' articles on the 2004 and 2005 and any allusions to cellular originality. I got one of the first PRO-2004's into this country in September, 1986, and had the cellular diode snipped and out within days.

(I had diode-programmed my PRO-2002 for the military air bands AND cellular back in 1981....and found that even though 800 MHz appeared in the display, the top end remained at 520 MHz. Bottom line is that I was hacking scanners long before there was ANY public knowledge that it was possible. I never wrote about it because no one was overly interested in scanners at that time.)

The memory and speed diode mods on my PRO-2004 followed immediately thereafter in September 1986. I was aware of these "discoveries" happening more or less simultaneously around the country. Pure, raw, discoveries, mine included, are not copyrightable. Only the published

wording of such matters is possible to copyright. There is no possibility of conflict with the routine "clip-a-diode" and "add-a-diode" typesof matrix programming hacks.

Aside from this simple shit, there's no conflict about anything else I wrote. It's ALL original by yours truly, with credit rendered to even those who sent me IDEAS to probe and explore.......names of Lynn Burk, Mark Persson, Milan Chepko, Terry Vaura, David Jones ....and many more who contributed however slight, to the information in my books. The names are THERE, clingberry. All you have to do is READ them instead of concocting malicious lies based on your axe to grind and a gamble that I'd be afraid to deal with you in public.

Parnass' name is not there, one because I hadn't heard of him before about 1992 after my 2nd book, and two, because he didn't contribute to ANY of the information or to my research. Simple as that. If he had, his name would have been there. There are several names credited in my books who I have never communicated with in my Life, but who I knew had been involved in the research or discoveries BEFORE I came up on the information. Read the books, DingleFritz: the names are there.

BC> You're saying Hobby Radio and notably scanning would be better off
BC> if you "killed me" or ran me off?

TS> No but your rhetoric use of profanity gets tiring and lessens the
TS> impact of your dialogs...

Oh. Well, did it ever occur to you that if it weren't for the lying sonsofbitches in this world, I might not feel like being so profane?

TS> You have a definite writing style that is truly unique...

Your spelling and grammar on a par with maybe an 8th grader. And a not

very bright one, at that. I haven't made mention of that little deficiency of YOURS until you chucked the first stone. Do take note of that.

> if you're not beating the thesarus to death

I don't use a thesarus. Don't need one.

> you're swearing...really make you sound intelligent.

Oh. Ok. I can live with that. I have always called a spade a spade,

and a shithead a shithead, and a lying sonofabitch a lying sonofabitch.
Mincing words isn't among my skills. Is that your problem with me?
Amd, ummmm, is English your native language?

I actually have the sister to this one ... I think its the PRO 23.... covers VHF Hi and AIR and I have no use for it at all...If anyone wants it make me an offer! Works great and is in
good shape..I even have lots of VHF-HI band freq's for it. Good radio for a rural area that has not yet gone to trunking or as an Aircraft monitor (where you dont need the flexibility of synthsized scanners)..E-Mail me if yr interested........

Not a problem in New Zealand, the government does restrict what we can
listen to. If the governments of this planet what to restrict access
to information for privacy reasons, then why do they all own monitoring
stations. NZ has a monitoring station at Waihopi, just outside Blenheim.

You can include 154.600 for effect also. It's widely used as an
intinerant, as is 154.570. (tho theyre esscentially low power
commercial freqs) 464.50 and .550 have a corresponding "input" freq of
5 mhz higher, making them fall into the 5 mhz band split for UHF.

Cellular Security Group which advertises in Monitoring Times says that they can install a downconverter for the Pro 26. This will allow you to receive cell calls on the miltary band. You select/deselect it by turning on the ATT. Costs about $99. I haven't tried it yet so I can't comment how well it works.

SL>Stephen

A tall order. I suggest you go to HRO in Sunnyvale or Scanners Unlimited
in San Carlos and purchase "Government Radio Systems - Golden Gate
Area". It has 110 pages of freqs that can mostly be heard from Oracle.
I've never been in the building, but it is quite tall and should make a
good scanning site.

To get you started, here are a few:

Redwood CIty primary 488.7875
tactical 488.5375
mutual aid 488.8875
tactical 2 488.7125
San Mateo primary 488.3125
tact 2 488.7125
mutual aid 488.8875

I was not refering to codeless techs. I was refering to individuals that want
to eliminate code all-to-together.

Has America gotten stupid? Forty years ago you could find people who could
do CW at speeds better than 35 wpm. Today, we have major problems with
5, 13, and 20 wpm.

Actually 145.55 is the simplex frequency used by MIR. It is allocated as a
packet frequency, so mostly you'll hear just packet noise. Very rarely
voice can be heard from MIR.

1042. bincancel:11 large binaries:AR78:@@NCM

Newsgroup: rec.radio.scanner
Date: 1996-01-13 00:00:00 UTC
From: red@redpoll.mrfs.oh.us
Message-ID: <ARMM-Report-78@redpoll.mrfs.oh.us>
Source record: 242536
Cross-posted to: alt.retromod,alt.nocem.misc,news.admin.net-abuse.announce,news.admin.net-abuse.misc,comp.graphics.rendering.raytracing,rec.outdoors.fishing,rec.radio.scanner,rec.pyrotechnics,rec.music.gdead

```
-----BEGIN PGP SIGNED MESSAGE-----

I have issued 11 cancels for large binary files (average size 327,803
characters - total size 3,605,842 characters) posted to 5 different
unmoderated discussion groups in the comp and rec hierarchies as
follows:
6 comp.graphics.rendering.raytracing
2 rec.outdoors.fishing
1 rec.radio.scanner
1 rec.pyrotechnics
1 rec.music.gdead

This report is being cross-posted to each affected newsgroup.

The criteria used to search for this batch of large binaries were:
SIZE: > 120,000 characters
NEWSGROUPS: Unmoderated biz, comp, misc, news, rec, sci
BINARY: (uuencoded, .uue, .zip, .ps, .gif, .bmp, .tif, .sit etc...)

Note that these criteria are independent of the content of the binary
file. If it is large enough, and if it is in an unmoderated group that
I scan, and if it doesn't make sense when viewed directly (I look at
each to be certain), then it is cancel fodder.

The cancels follow the "<cancel.", "cyberspam!", "bincancel!",
and "X-Canceled-By: " conventions. News administrators may block
these cancel messages specifically by aliasing out "bincancel" or
generally by aliasing out "cyberspam".

In my opinion, the best way to distribute binary files is via ftp or
the web. With the ready availablity of ftpmail servers, even uucp
sites can retrieve binaries from ftp sites.

However, if you really must post a binary to Usenet, please post it to
an appropriate binaries newsgroup. Then, if you like, post something
in the appropriate discussion group telling people where to find the
binary in the binaries group (a "pointer" to the binary). This will
permit news administrators and users to decide for themselves whether
to receive the binary files.

There has been a long-standing consensus among news administrators that
binaries belong in binaries newsgroups, and not elsewhere. There seems
to be an emerging consensus supporting the cancellation of large
binaries in discussion groups as long as appropriate protocols are
followed. I am testing that consenus and developing a protocol.
```

Please direct public feedback to news.admin.net-abuse.misc and private
feedback to myself. If there is an unmoderated binaries group in the
hierarchies that I scan, I don't know about it yet. Feel free to
enlighten me.

The sizes and headers of the canceled binaries follow:

Hmmm,
Perhaps in your own eyes or your own opinion, but not mine.
I think Bill has demonstrated an effective and efficient way to
deal with slander on the internet. If Bill's response has some
shock value well "...heat...kitchen..." get it .;-). What is
wrong with some demonstrative indignation? Most internet slanderers
pick on victims who have no voice for defense on the net. These
goof balls pick on Bill who not only has a voice but can put some
fire behind it. Seeing the reaction of the slanderers to Bill's
rebuttals has been amusing.

Best regards,
wynnt

I don't have a temper in virtuality. I just don't play silly games and mince words. Neither do I share the idiotic opinion that it's "ok to be the aggressor, and wrong to defend...." This is how you and some others come off. I don't share your views.....

> I have read your books and columns and in the past had some
>respect for you and your efforts.

Oh gawd, here comes another threat now....

>your postings particularly with the challenges and foul language
>do little to shore up your public image.

I don't care about "image", liver-lips. Geez! What are you doing for YOUR image right now? When I saw your name in the message queue, you were a total neutral-to-positive in my mind. As I read down your needless and senseless post, the image I had of you shot like a rocket down to cesspool level. Two way street, man.

>. I know my respect for you has been diminished
>and I am sure the respect of others has also.

Age old syndrome....speaking for others so you can feel justified in taking a spit at me. Geezus, that's what makes you and me so different. You NEED the approval and "permission" of others. Leave 'em out of it. I can't talk to THEM and YOU, too. You are not empowered to speak for anyone. Marginally for yourself.

Oh......my respect for you has diminished as well. Here, write this down....or MARK-COPY-PASTE it to a file: I have no concern for people who play one-way streets. Your respect for me has no more significance than mine for you. If you are so fickle as to throw that leverage on me out here in a public forum, then you are among those elite few who have a standing invitation to eat my shorts.

It is a very simple and equitable deal, actually. No problem.

Now then, here is the crux of it all. Drop into the Lotus position and meditate upon the gunk in your navel and consider HOW you really don't care what I think of you.....and then place an EQUALS (=) sign next to that and ponder how I really don't care what you think of me. Here....if you are into math, this is what it looks like:

1 = 1

See?

Equality. That's the way it is supposed to be, right? But that's not how you stupidly come off......trying to leverage your respect for me into some sort of a power play in a totally unrelated business matter.

Geez, dude, I write books and do a few other things related to radio to help earn a living. You come off as me being inferior because of that. So what if I stop writing books and developing technical projects for people who can't do it themselves. Would that make me rise to your "do nothing" level?

So you want to cut off your nose to spite your face? Ok. I really can stop writing, if need be. But tell me......WHO will take my place? Would you get Andy Moss to write the next book for you? How about ol' Peter (PjB) Breath? Or that lying, conivving TSMITH?

Or how about YOU? Maybe you'd like to step in my place?

Look dude....come one....come all! Leave my books and my living OUT of this forum unless you need technical support. You are NOT going to leverage your brand of sorry, low-life thinking on me. This is not a Radio Shack store where I have to kiss your ass; wipe your snotty nose; and take your verbal abuse.....all for what, a sale? Aw, fer chrissakes, man......play like a cow turd and hit the trail, will ya?

I am not here for your stupid games. I am not here to sell anything to you. If you think I don't know what I am talking about, then ignore me and don't read or apply the information in my books.

If you would like to compete with me....then do that. I will HELP you! I love competition! I will help you find a publisher or an outlet for your goods. The more, the merrier!

But don't shake a stick at me. Don't threaten me. Don't leverage me. I will NOT deal with a soul on this planet but what it's a straight up, large-print kind of a deal, period. You want something in addition to the deal, then you spell it out in advance in the large print so I can see if I have it or not. And I damn well might not have it. I don't have something for everyone and don't pretend to; not like Radio Shack and other businesses to which you have become accustomed, who will do ANYTHING to dip a hand into your wallet.

From me.....all you get is a square deal and then ONLY if I get one. If that ain't good enough, then eat my shorts or go lay an egg......

Two-way street Bill

No kidding. Something's weird about T-801 in the PRO-2004/5/6 scanners. They all run pretty darned warm. Yet, I run one of my scanners from an AC Adapter cube plugged into a power strip on the back of the bench, and it runs barely warm to the touch. Those things are nothing more than a transformer, rectifier, filter capacitor, and *maybe* a bit of noise/EMI filtering. Same as what's inside the scanner. One runs hot; the other runs cool.

Gotta be differences in the transformers' efficiency ratings. The ones in the scanners appear to be 50%-60% efficient, a rather low number when most power transformers are 90%-95% efficient.
Must be the core and/or lamination design where hysteresis losses are greater in the scanners' transformers. I've been thinking of trying a different transformer just for the hell of it.

BTW, in worst cases, you can advise your constituents to remove the transformer from inside the scanner; mount it externally and run the secondary wires back inside to their normal termination points. That will keep the heat loss outside the scanner for much the same effect as using an external DC supply.

>Have you ever tried to hold a 10W lightbulb in your hand? :-)

Don't see too many of those, but I ignorantly clapse a hold of a 10-watt power resistor now and again after it's been in circuit for a while. Shooooooey, those mothers get warm.

Military air traffic takes place in the 200-350 MHz range. A good one to always keep programmed is 243.0. This is called GUARD, and is the emergency channel all military traffic uses. Also, most FAA sectional charts (availible at pilot supply stores) list the military equivalent of their communication frequencies.

I have a 7100 and haven't had this problem. Like you, the most
puzzling thing to me about it is that the memory is backed up by an
internal battery so when you change the AAs the memory isn't lost.
So why does loose batteries cause memory loss?

Hypothesis:
Perhaps whatever caused the batteries to be loose (did you drop it?)
caused a break in a circuit board trace, wire, etc. that causes a
memory reset when the case is flexed... a occurrance that may happen
concurrently, but coincidentally when the batteries fall out.
I.E. it's not the batteries that cause the problem but a loose
connection somewhere inside the radio.

Just an idea.

Good luck finding the solution.

In article <4d6ohu$o51@voyager.ff.tds.com>, RR <riecks@tds.com> wrote:
>Does anyone know for sure what scrambling scheme is used in the MOTOROLA
>"Secure-Clear" telephones? Is it the "speech inversion" that we hear a
>lot about, or something more complicated?
>
>Just curious, of course!

This was written & first published on the Net by myself several years
ago, but I believe it is still valid info...

****

"Why A Motorola Cordless Phone?"

"Cordless phone eavesdroppers are everywhere" says pro golfer Lee
Trevino, spokesman for Motorola. "But with my Motorola Secure Clear
Cordless Phone, my private conversations stay private."

So says a glossy brochure (# BA-81) that Motorola's Consumer
Products Division (telephone # 800/331-6456) distributes to promote their
new 'secure' cordless phone product line. When I first read
the cover of the brochure, I said to myself, "Wow, I wonder what
sophisticated technology it must use?" Motorola has been developing and
selling secure voice & data systems, from DVP & DES up to the current
'FASCINATOR' algorithm for classified military & federal government
secure voice for many years.

Page Two of the slick brochure provides some rhetorical questions and
answers:

****
Why Motorola Cordless Phones?

Q. What is meant by Secure Clear?

Secure Clear is an exclusive technology that assures you no
eavesdroppers will be able to use another cordless phone, scanner
or baby monitor to listen in to your cordless conversations.

Q. How difficult is it to eavesdrop on someone's cordless
conversation?

It's not difficult at all. Simply by operating a cordless
phone, scanner or baby monitor on the same channel as you're on, an
eavesdropper can listen in. Security codes alone DO NOT prevent
eavesdropping.

Q. What are security codes and what do they do?

Security codes allow the handset and base to communicate with each other. With the Secure Clear cordless phone, one of 65,000 possible codes are randomly assigned every time you set the handset in the base. This means that a neighbor cannot use his handset to link with your base and have phone calls charged to your phone number.

Q. Describe the basic difference between Secure Clear and security codes.

Secure Clear protects against eavesdropping. Security codes prevent the unauthorized use of your phone line. Usually all cordless phones have security codes, but not both.

Q. What is the purpose of the Secure Clear demo?

The Secure Clear demo is a unique feature of Motorola phones that allows you to actually experience what an eavesdropper would hear when trying to listen to your conversation. By pressing the SECURE DEMO button on the Motorola phone, you and the person on the other end will hear the same scrambled noise an eavesdropper would hear.

****

Hmmm... I went to the Motorola Secure Clear cordless phone display at a Sears store, took a deep breath, & hit the demo button in order to hear what the "scrambled noise" which would protect a conversation from eavesdropping sounded like.
White-noise like that of a digital data stream? Rapid analog time-domain scrambling? No, the scrambled "noise" sounded like inverted analog voice. That's right, they're using the 40 or 50 year old (3kHz baseband) speech inversion system --the same one which they stopped marketing for their commercial two-way radio gear about a decade ago-- to make Lee Trevino's & other ignorant people's "private conversations stay private."

For those of you not familiar with speech inversion, it simply flip-flops the voice spectrum so that high pitched sounds are low, & vice versa. It sounds a lot like Single Side Band (SSB) transmissions, although it is very tricky to get a SSB receiver to decode speech-inversion scrambling. Prior to 1986, several companies -- Don Nobles, Capri Electronics, etc., sold inexpensive kits or scanner add-ons that could be used to decode speech inversion. Several electronics magazines also published schematics for making your own from scratch, at a cost of about $5. After the Electronic Communications Privacy Act of 1986, it became illegal to decode or decipher encrypted communications which you weren't a legitimate party to, so the standard practice of selling these quasi-legal products as 'experimental kits' or 'for educational purposes only' became common. Today, some companies will not specifically sell a 'speech-inversion descrambler,' but instead market a 'speech inversion scrambling system' which means the kit will encode as well as decode

speech inversion, although most people buy them
simply to hook up to their scanners & monitor the few public safety
agencies and business that (still) use speech-inversion scrambling.

Yes, technically, it is a felony for you to use a speech-inversion
descrambler to monitor these Motorola 'Secure Clear' cordless. Or for
that matter, the new Radio Shack DUoPHONE ET-499, cordless phone that
also depends on speech-inversion for privacy protection. The public
utility of the ECPA has been argued about ever since before it was
enacted. It is rather obvious that the ECPA was pushed upon the
ignorant, money-hungry Congress by the powerful (& wealthy) Cellular
Telephone Industry Association (so the CTIA could propagate
misinformation to the public, but that's another story...). I also
realize that the 46/49MHz cordless phone channels are apparently
allocated for analog-voice only.

Despite the ECPA, it is unconscionable to me that Motorola --who
surely knows better-- would produce the slick brochure & specifically
market the 'Secure Clear' line as being invulnerable to eavesdropping.
Their wording unequivocally gives the impression that the 'Secure Clear'
conversations are secure, not
only from other cordless phone & baby monitors, which have several common
frequencies, but also against communications hobbyists with scanner radios.

It is bad enough that many public safety officers still think that
by using the 'PL' ('Private Line,' also known as CTCSS) setting on their
Motorola two-way radios, no one else can listen in. While the 'Private
Line' fiasco might be attributable to misconception on the part of the
radio users, in my opinion, Motorola's Consumer Products Division has to
know that there are thousands of scanner monitors who have the technical
ability to defeat the speech-inversion 'Secure Clear' system. A Motorola
representative at the 1992 Summer Consumer Electronics Show in Chicago
confirmed this to me, with a smirk on his face.

There's a big difference between Motorola's aforementioned wording &
that of Radio Shack's on page 3 of their 1993 catalog:

New! Voice-Scrambling Cordless Telephone
DUoFONE ET-499. Cordless phones are great.
But since they transmit over the airwaves,
your private conversations could be
monitored. Now you can enjoy cordless
convenience with voice scrambling for
added [emphasis theirs] privacy protection --
frequency inversion makes transmissions
between the handset and base unintelligible...

It's not "Motorola should know better." Motorola DOES know better.
Otherwise, they wouldn't be spending time or money on truly 'secure'
(based on current technology, of course) communications
and transmission security systems for the government.

I sure am thankful that our federal government & military users of secure-mode communications systems don't rely on Motorola's marketing department to provide factual information as to the level of security provided by Motorola equipment. Too bad that for the most part, the public does.

For anyone looking for a cordless telephone that offers a decent level of privacy, take a look at some of the new cordless phones that use the 900MHz band. Most of the new ones not only use CVSD digital voice for the RF link, but also direct-sequence spread spectrum. By no means are these phones secure ('encoded,' yes, but 'encrypted,' generally not), despite some of the wording in their owner's manuals. Some of the Tropez 900 models actually seems to generate a very weak analog harmonic in the 440MHz spectrum, but you'll still be a lot better off than poor Lee Trevino.

I also have Access/Excell/Word in MS Office, but I found that FileMaker Pro (I have it for Windows and Mac) is easier for me. I started my computer life on the Mac, and still prefer it over Windows, but there are times when I am forced to use the Windows machine.

FMP is very easy to use, to design new layouts is a snap, and the files are transparent to each format (Mac/Windows). I have found Access to be more powerful, especially with larger files (FMP has a file limit of 32MB in V2.xx, although in the v3.0 this has been eliminated). FMP tends to get bogged down in huge files. FMP and Access both use their own formats for databases. Fox Pro, and other D'Base based databases use .DBF. FMP and Access can read DBF's, but the information is then stored in the unique format.

I have a BC3000XLT for almost a year. I had to replace the batt pack as it dropped down to lasting only 4 hours (the extra pack I have lasted about 7.5 hours; the replacement lasts almost 8 hours). I run the batts down all the way. I am curious what you mean by the batteries lasting "forever". My BC200XLT batteries last 12-13 hours with the low-batt feature disabled.

Also, please let me know about the hidden keypress codes for 800 Mhz.

Thanks,
Gary Schmidt - Milwaukee FIRENET

Which scanner should I get?
I just bought a Radio Shack Pro 51 and in general I am happy with it, but it doesn't have cellular capabilities (I looked around the San Bernardino area and all of the Pro 46s & Pro 51s seem to have been "decellularized". I figured that while I'm buying my first scanner I might as well try to get one with cellular capabilities while I can.
I read in the Grove web site that the Bearcat 855-XLT is "cellular restorable", what exactly does that mean, just buying an additional chip, or soldering in something ?
From what I've read it doesn't sound like I can restore my Pro 51 to have cellular capabilities.
Does anybody have any suggestions on what type of scanner I could get with cellular (888???), or the possibility to upgrade to cellular. I can afford a scanner up to about the mid $200 range.
I also have relatives in Germany that could send me a scanner bought there if that might be a good option.

First of all you'd be lucky if you live close to someone with a 900MHz
phone they still don't outsell the 46MHz phones, and the other thing is
that those phones will either be digital, or spread spectrum, in either
case you won't be able to pick it up on your scanner.

Wow, is this bait or what? You REALLY need to come to terms with what radio is and how it works. Almost everything in the field of electronics works with some form of "radio" technology. There are quite a few books out there that can explain it better than anyone here can in this limited bandwidth environment.

To answer your question simply, No it is not possible to modify a receive-only scanner to talk to all of those people you hear (unless of course those voices are only in your head and the scanner is turned off).

Steve

1081. Re: 900 MHz phone frequencies?

Newsgroup: rec.radio.scanner
Date: 1996-01-13 00:00:00 UTC
From: RR <riecks@tds.com>
Message-ID: <4d958b$epm@voyager.ff.tds.com>
Source record: 242575

I COULD be wrong, but I believe that not all 900 Mhz phones use digital transmission or spread-spectrum. In fact, I have trouble finding spread-spectrum phones in the stores these days... I remember seeing a few many months ago, but they were expensive compared to the others (usu. $300+).

The 900 Mhz phones generally use the 902-928MHZ band set-aside for amateur radio, experimental stuff, and low-power phones and junk. Some wireless LANs use this band as well, though they are almost always spread-spectrum.

Each manufacturer selects their own frequencies when they assign "channels", I believe. I saw some posted here once, but I don't have them anymore.

To All:
I am considering the purchase of a scanner. I am looking
at RS 2026/Uniden BC178XLT or RS2037. Is there a Uniden
equivalent to the RS2037? I would appreciate hearing about
operational experience with these scanners. It appears to me that
Radio Shack may be a little high in price compared to Uniden. I
also want to keep the price at or below $200, so I will probably
wait for a sale. My thanks in Advance to all who respond!

1084. Re: Mall of America

From: JALM65A@prodigy.com
Message-ID: <4d7rtc$2cb2@usenetw1.news.prodigy.com>
Source record: 242578

steve...here's the frequencies i have listed for the mall of america;

858.6125
859.6125
860.6125

as you can see, the mall is on a trunk frequency...there may be a few additional adjacent 8**.6125's. probably are.

the earlier post re: the mall dealt with security guards and scanning at the mall. my observation was that the guards have other priorities, and that as long as you don't follow them around with a 12-element yagi, they'll leave you alone. a bit of discretion goes a long way here, as in other contexts.

as for your housing accommondations...you could do worse.

hint: do the 'mystery mine ride' at camp snoopy (virtual reality type ride),
skip the rest.

enjoy your visit to the twin cities. spend lots of money.

1090. Really basic scanning question...

Newsgroup: rec.radio.scanner
Date: 1996-01-13 00:00:00 UTC
From: smcintyre@whoi.edu
Message-ID: <smcintyre-1301962237210001@joltcola.whoi.edu>
Source record: 242634

Hi,

I've never done any scanning before, but on a whim (actually, my wife forbade me from buying a home theatre system) I bought a Uniden SportsCat (only model in stock that was handheld) sc150b. So far I've had a fun evening of hearing all sorts of interesting things...but I've got what must be a simple question:

Every now and then when listening to what I think are cellular phone calls (because one person or other says "I'm on the car phone"), I hear a Bzzt sound...sometimes twice in a row...sometimes just once. At about this time, I lose the signal and it goes quiet.

What's happening?

My hunch: The cellphone person was in transit and shifted cells and the phone switched frequencies...or they moved around enough within the cell to cause something similar to happen. Is this possible, or is this just a amateur stab in the dark?

Thanks!

Scott

Yes, I believe we have always been in basic agreement on the basic point, just discussing our perspectives on the specifics. The transformer itself is in question too. Since I have seen transformers generate so much heat that the case plastic is affected, the quality and original specifications appear to be marginal.

Have you ever tried to hold a 10W lightbulb in your hand? :-)

Well, you'd have been pasted up side the chops for your time and
trouble, more'n likely. There is a strange mindset around some
circles that says it's perfectly ok to initiate trouble, but it's a
violation of the 11th Commandment and the Constitution to smack the
bastards back. I plumb don't understand that.

But it's a damn good thing that mindset ain't sane out there in real
life. I reckon every rapist, robber, looter, and stabber wishes to
geeminy they could do something and not have to "pay". It's only when
you put a price on something that folks back off and think twice.

But in some of these forums, the mentality is so low-life that they
actually think it's ok to lie through their harelips and then they
take offense when you pop 'em in the chops. It's a small number who
think that way, but they howl, whine, and snivel so loudly that it
sounds like a mix of acid rock, punk rock, and heavy metal music all
in one.

>I've gained alot of scanner knowledge from reading your posts on fidonet
>a couple of years back. Ignore the net-noisy whiners...if you can.

Yeah, there's a couple already I would walk across the street to piss
on if they were on fire. And a half dozen more fixing to get added to
that list. I just love the ones that act like they walk on water and
sport golden halos floating above their skulls. Those are the ones
who snivel the loudest when you call attention to their limited gene
pools after they pop out of no where to tell you everything that's
wrong with ya. Good grief, they just can't stand it when you point
out the gaps between their teeth; the holes in their lips; and the
clingberries all over 'em.

Anyway, scanners and scanning is what we're all about, but apparently
I've trod on someone's turf, so it will take 'em a while to get used
to having to move over a little. Ain't nuthin' better than an elbow
in the ribs for getting some fathead to move over a bit, unless maybe
its a boiled egg, anchovy pizza, and beer fart. That'll get most of
'em to moving right off. Of course, then it's only the smart fellers
who will move. The fart smellers are a different story altogether.

Well, you take it easy and hang tight. We'll be getting down on
scanners pretty soon. Now that's what I like to attack!

Bill

Is the PRO-25 the same as the PRO-26. Mine came with "Canada Only" all over the box and it picks up cell phones quite well. Where I live, the range of 896.1125-956 picks up tons of calls. And yes, they're cell phones not the cordless 900mhz phones.

Dear LI PIX:

Sir, I have read several of your posts. While it would be ridiculous to say that I have -always- agreed with your point of view, I certainly feel that you have at times articulated position(s) which have merit.

I'm not exactly sure what caused you to launch into the tirade above, but you sir have a serious problem.

While the reasons for choosing a radio system can be as varied as those of choosing a camera, it is as ridiculous for you to have made your ill-founded claims as it would be for me (or anyone else) to make a claim "all photographers are pornographers".

You are obviously concerned about what you perceive to be a "right". Well, you do have rights, specifically those addressed in your State's Public Records Act.

You also have an obligation. Before you fly off the handle, you have the obligation to learn more about specifically WHY many Public Safety agencies in the more urban areas will be MANDATED to switch to digital technology. It has EVERYTHING to do with spectral efficiency, and NOTHING to do with "encryption".

Are their problem agencies? Sure. But as an "enlightened" member of the media, you show a rather monocular focus. I am frankly embarassed by your post.

Contact your local APCO Chapter to learn more. Once you know what's happening, you won't find the need to offer such vulagar and disrepective discourse to the men and women who lay their lives on the line every day of the year.

I'm not looking for frequency-expanding MODs, but I _do_ think that making these changes would be nice. Does anyone know how to:

Remove the "beep" that signals a low-battery? I can see it's low by the display. I don't need the annoying beep.

Halve or quarter the output through the 1/8" jack. The jack is probably designed for an external speaker, but I really just use it for a headphone. The output is overkill - I usually listen to it at about 1/6 full volume, but this makes the background noise of the amplifier in it a significant part of the sound. By taking the output down I could listen to the radio with the dial at near full volume and have the signal to noise ratio higher. (I'm not looking to reduce the noise - I want to increase the signal's proportion.)

Otherwise, it's a fine scanner.

>L2 reddish coil or loop, next to the antenna.
>Does anybody know what this L2 is, and would removing
>it, give me access to those cellular freq?
>

Mod's for different model numbers absolutely do not work with other models. Don't cut it if you're not sure. Clipping the coil you see in the 2035 will probably loose RF into the front end, killing all signals. The only way I saw of restoring cell to a 2035 is by buying a replacement mother board. Saw 1 in a Monitoring Times mag classifieds section once, couple months ago. Good luck.

> line of shit a mile wide. So ACT! Get off your duff and do it.
> You're not a helpless nincompoop, are you?

Get off my Duff ??? Many of us wish you'd bite your CHEEK !
"What issue is that of yours" ...(Haha) Looks like I hit a funnybone !
Sensitive issue, isn't it !
The named FIDO conference is supposed to be for non-commercial use...
you exploit it to line your pockets often in a subtle manner.

> Ummmmm, by the way......you are stepping well out of bounds on this
> issue, Mr. Duff. I'd NOT persist, if I were you. You are on
> "borrowed" time, as it is. Take the draw while you can. Give it a
> rest. If you persist with the idea of "winning", you will lose.
> Take the draw.

"Stepping out of bounds"? "Borrowed time"? "Give it a rest"?
"You will 'lose' "?
Is this a threat ? Wadda ya gonna do...kick me off the FIDONET
Mr.Moderator ? Or will you sick the "thought Police" on me ?

> >I always meant to ask...did YOU design and write the code
> >for the scanner interface that you sell ?
>
> As a matter of fact, it was a joint effort between a programmer and
> myself. He knew nothing about scanners and I knew little of coding.
> It was a dual, joint effort. Why do you ask? I'm sure you're not
> really interested at face value.

What I was curious about was your knowledge of microcontrollers
(and PLLs :). I design my own. Just wondering if we could chat
mnemonics and loop filters but I guess not.

Nothing more than the concern about commercial advertising
here on the net and on FIDO from this person !
I've vented my steam...maybe from having to read too much
Cheek/Moss diatribe.

Here in the Phoenix area, AIR EVAC uses 155.325 as their dispatch frequency
I also hear them on the local fire department or police frequencies when they
are contacting their ground contact. The Highway patrol (DPS/Department
of Public Safety) helicopters also do this type of work. they can be
heard on the DPS frequencies (460.3, 460.325, 460.025, 460.425, 460.475)
as well as on the medcom frequencies. YOu will also find DPS "RANGER"
popping up on local pd/fd frequencies when they are assisting a local PD/FD.

YOu cal also monitor Phoenix tower 118.7 or 120.9

: access to listen to it.

You do have a somewhat of a point here, but at the same time, my taxes go to building, flying and maintaining B-1 bombers. So I should be able to go take one out for a spin anytime right?

: You MUST give members of the media the right to purchase at their expense
: their radios. Why? Public support will fall.

Most departments with encryption, and with trunking, do make non-transmitable radios available for the local media outlets to purchase so they can listen in.

: The cops & fire dept. are lazy . They don't do a damn thing. They tell us
: what they want to tell us.

So how long have you been living in your cave? You know, I spend a hell of a lot of time at emergency incidents and around law enforcement and firefighting personell. The last thing that I think they are is lazy. Go on a ride along with your local PD and/or Fire Dept. It's a lot harder work than you may think.

: Do you really think a PIO is going to tell the media "We fu**ed up, when
: the media would not have otherwise know about it?

Any journalist or other media type that always takes a PIO's word at face value 100% of the time had better start practicing thier burger flipping skills. (Sorry Brian!) A good journalist knows that there is more than one road to get the information they need. Case in point, we had a big three alarm fire about a month ago. There were some questions on how the department handled the fire. We talked to the owner of the building, got his side, then went back to the FD and confronted them with it. They admitted that a couple of things could have been done better, and those of us who are *really good* journalists, dug a little deeper and found people in the department itself who agreed with the owner.

Source record: 242659

Firenet is a paging service available to any interested fire buffs.

The service provides an alphanumeric pager that will inform you of all working fires in the area. Also included are any special or unusual responses of area departments.

Greater alarms from around the country are also paged out. The service operates 24 hours a day, however the out-of-state greaters occurring overnight are not paged out until morning.

An optional alternative service, FIRENET LITE, pages out only local greater alarms, 24 hours a day.

The pager can also be used as a normal numeric pager, whereby, someone can call the pager number and key a numeric message (such as a phone number that you should call) through their telephone keypad. Great for family, friends or employer to get hold of you.

Cost is $15 per month. E-mail me if you want more information.

>
>Is a discone not good?
>What do you recommend in the way of scanner antennas?

==========
As long as the attic doesn't have a metal roof, there's no problem with
it being there.
A discone is a good antenna, for what it does. The discone design is
meqant to be a very wide-band antenna; it has no gain to speak of, and
it's omnidirectional. If this is what you want, it's great.
Other antennas will have different characteristics. Many have gain
(better ability to suck signals out of the air). They get this gain
different ways. Some are narrow-band antennas, some are directional, some
are combinations of directional and wide- or narrow-band antennas.

Which is best? The one that best serves *your* needs.

If you are, for example, in a large city with signals coming from all
around, an omnidirectional antenna would probably be best.
If, on the other hand, you live in the boonies, a directional antenna
would probably serve you better, so you can aim the antenna towards the
area where the signals are coming from. In that case, gain would be a
strong consideration, also.
Hope this helps...

Bill

I would like to see:
1. A real S-meter!
2. A Center-tuning Meter.
3. Tunable RF notch-filters, to knock down strong Pager freqs.
4. Selectable RF band-pass filters, same reason.
5. Multiple Scan-limit ranges, that can work together or

individually.
6. Lots of Memories to hold frequencies to be LOCKED OUT during
band- or limit-scanning.
7. More FM bandwidth choices
8. USB, LSB
9. A voice synthesizer to announce frequencies during band-
or limit scanning, so your tape recorder can record it.
10. Tuning knob, with selectable tuning steps
11. Built-in computer interface, with FULL input/output capability
12. Full legal spectrum coverage, 100Khz-2000Mhz
13. RF Gain control.

(Hey, it's a WISH LIST, no?)

73 all, Brett

1133. AR8000 TIP - Scanning Trunking Systems Use Select Scan

Newsgroup: rec.radio.scanner
Date: 1996-01-14 00:00:00 UTC
From: vhealey@crl.com
Message-ID: <30f873ac.7403782@nntp.crl.com>
Source record: 242438
Cross-posted to: rec.radio.scanner,alt.radio.scanner

What do you think of scanning the 800 MHZ trunking systems used by the police? Do you like it or hate it?

Cobb County GA and Atlanta GA have moved to the 800 MHZ bands in the last year or so. My first reaction was oh no! Then I discovered that I could pick up far more then previously because of the intelligence found in the phone patches the commanders were always running using their new radios. The downside is that there is a lot of 'crap' also in some of those lengthy phone patches when they call their current 'lover'. As Cobb County abandoned 6 70cm frequencies 3 low vhf a half dozen vhf frequencies for putting everything on a fifteen channel TRS followed by local cities like Smyrna GA moving FIRE and POLICE to the same system I realized that I could hear more action with far fewer frequencies programmed into a radio then before. BUT it was harder to follow a certain thing like a fire or a neat speed trap because of the channel hopping nature of TRS.

I can not think of any other hand held scanner that is more suitable for scanning the cellular type TRS bands then the AR8000 (AR8K).
What have I discovered about the AR8K that now makes it my preferred receiver for the trs systems? The SELECT SCAN FEATURE.
Using this feature I can now comfortably follow the fires, drug busts, and speed traps with an absolute minimum of irritation from unwanted stuff.

Lets use the fifteen channel TRS for example even though this applies to any size TRS. One channel is devoted to control, so we are only listening to 14 channels. The control channel is tagged by the PASS key so it will not be scanned. As I scan the rest I noticed that the phone patchs only appear on two channels so these can be locked out by PASS if desired. Now for just basically eavesdropping on the county action it is ok to just let the scanner bounce around the remaining active channels. One notices that the same related comms appear only on certain channels. Usually I recognize the same voice or it may be the content that I notice like details of a fire dispatch. The speed trap on the interstate I-285 I was following today appeared only on channels C6, C12, C14, C15 as programmed into my AR8000. Now on virtually every other scanner made in order to follow only that speed trap one would have to lock out all the remaining undesired channels one by one. BUMMER! But on the AR8000 all one has to do is TAG the channels for select scan. Then to hear basically only the speed trap activate select scan. If something else pops up, one of my selected channels was being used as part of the fire grouping, just twist the top knob to move on. I was able to follow the action which was of

interest to me since I was out driving perfectly. Now notice this. I heard the laser officer ask one of the cars to switch to talk around for a private chat. He wasn't in my selected grouping! No problem I hit scan until I found them and I was able to follow them even though he asked him to switch manually to still another channel. FLIP I had them again. The conversation was about one of the women in the radio control room back at HQ. If I was using any scanner with locked out channels I would still be fumbling with the darn thing long after the secret conversation was over. FUNC SELECT SCAN put me back at the scene of the speed trap a second after this brief interlude as they resumed the action.

Select scan is valuable because the scan list can be cleared completely by a couple of key strokes and another list started by tagging channels as they are heard. An incorrectly selected channel can be individually dropped from the list. Since you are selecting only a few channels the scan seems very fast as the list is repeated many times per second. I find that I can clear the list and start a new one on the fly very fast now. For example early today I heard on WGST that there was a breaking story of a serious gas leak in GWINNETT county which has another TRS system. Within minutes I had selected each of the channels that had activity relating to this event. Then with SELECT SCAN I was able to follow everything until they successfully clamped the line and let traffic flow again on a major artery in NW Metro Atlanta. How do I know I have all the channels? If I hear part of the conversation and then a channel switch and I don't immediately hear it continue I check to see which channel I am missing by hitting normal SCAN. SELECT SCAN also has the advantage of ordering the channels in the actual pattern that the TRS system is using for that channel grouping if you are careful as you tag each needed channel.
Read back your list and look at the scan order as compared to the physical order in the scanner!

SELECT SCAN is discussed on page 6, and pages 69 through 73 of the AOR AR8000 users manual.

Another use for select scan is in traveling in an area that has a duplex radio system which doesn't repeat the mobile. The state of Alabama has such a system for the state police. Place the base and mobile in your select scan list and as fast as the base drops carrier and the mobile replies you have him. Any other scanner you would have to scan through a bank of 20 to 100 frequencies to hear both sides of the conversation. Some folks get around this by repeating the frequencies often in memory but you don't have to waste memory like this in the AR8000! Another way to accomplish the same thing manually in the AR8000 is to place both frequencies in the dual mode vfo's but you have to manually switch between each which I don't care for while driving.

From: minesg@aol.com
Message-ID: <4dckon$evr@newsbf02.news.aol.com>
Source record: 242439

Here is a tiny sample of some of the Mountain Home frequencies contained in the sources noted below.

126.2 Tower (VHF)
253.5 Tower (UHF)
284.0 Ground Controlled Approach
349.0 Ground Controlled Approach
369.2 Ground Controlled Approach
342.5 Metro (weather)
276.3 389th FS CP
276.1 390th FS CP
276.8 391st FS CP
295.4 Air refueling track #610 primary
292.6 Air refueling track #610 secondary

One of the best sources of military aviation frequencies is the "Directory of North American Military Aviation Communications." It comes in three or four regional volumes and covers HF, VHF and UHF. I highly recommend this guide. I think it's available from CRB Research. Another good book that covers all the major Air Force bases is "Monitoring the Military" I got a copy from Grove.

BTW, let me know if you ever hear the following call signs in your listening area:

HUSKER (KC-135R / 155th ARG, NE ANG)
SNOOP (RC-135V / 55th W, Offutt AFB, NE)
GORDO (E-4B / 55th W, Offutt AFB, NE)
LOOK (EC-135C / 55th W, Offut AFB, NE)
SPIRIT (B-2A / 509th W, Whiteman AFB, MO)

Gerald M.
Omaha, Nebraska

There is another way. If everyone that wants this to stop would send
EMAIL to the offending parties it would jam the mail boxes of said parties.
Every time you see a post that is does not belong in this newsgroup just
EMAIL it to the
author. You don't even have to add anything to the message just send it
back to the author. That way it doesn't clutter up this newsgroup and it
will let the offenders know that they are unwelcomed!
If everone that reads this newsgroup sends Email they will get alot of mail!

Hi Jeff.

"Track tuning" is the name Electra used for the patented innovation
which tunes the front end circuitry of a radio to preserve sensitivity
across a wide range of frequencies. It is accomplished by
biasing a set of variable capacitance diodes in the front
end tuned circuits. The amount of voltage applied to the diodes
depends on what part of the band the radio is tuned.

Track tuning has nothing to do with determining where the center of
a signal is. Track tuning may be found in most Electra/Bearcat
scanner models going back several years. The economy Bearcat 5
was a noteworthy exception.

Perhaps you have "track tuning" confused with "center tuning,"
which is implemented by a "window detector" circuit. The window
detector uses operational amplifiers whose output is driven
by sensing current at the discriminator. If the scanner is
tuned exactly to the center of a signal, the discriminator current
will be zero. If it is tuned off center, there will be discriminator
current (plus or minus, depending on whether you are tuned
above or below the signal). The window detector circuit outputs a logic
level signal which indicates whether the receiver is tuned
within a "window" (perhaps + or - 5 kHz) of the signal's center.

The window detector output is used to tell the scanner when to stop
searching so it won't pause prematurely -- off to the side of a signal.

Most GRE-made Radio Shack scanners use center tuning, too.
The Regency K500 and M400 are two examples of scanners which
lack center tuning, which makes searching more difficult.

Uniden's first "Bearcat" scanner, the BC800XLT, went one step
further...it had AFC (automatic frequency control) in the
800 MHz band. The BC800XLT tuned to the center of an 800
MHz signal during a search but didn't change the display. The AFC

made it difficult to tell whether the frequency reading was correct
because the signal sounded on-frequency when the display was
off by 12.5 kHz.

1142. Best Scanner/SCPC Receiver and Shortwave Receiver

Newsgroup: rec.radio.scanner
Date: 1996-01-14 00:00:00 UTC
From: newcaesar@aol.com
Message-ID: <4da7e5$ein@newsbf02.news.aol.com>
Source record: 242487

I was wondering If any of you could help me out,with the problem of choosing
a scanner/Satellite SCPC receiver and a Shortwave receiver for under $1000 combined.The type of scanner I am looking for is one that has at least 250 memories,at least 50ch/sec scanning speed,and can tune in WFM from 950 Mhz- 1450 Mhz.I have tried out the AOR AR-8000 and was disappointed with the imaging problem.I was trying to tune in SCPC signals with the receiver connected to the Satellite LNB,and instead I was getting Cellular and General Mobile signals in the 1200 Mhz - 1450 Mhz range.I need a receiver with NO IMAGES in the 950 Mhz- 1450 Mhz range.Now too the ShortWave receiver.I would like a shortwave receiver with good sensitivity especially on SSB frequencies.I would also like a receiver with strong CLEAR audio.It is a must that the receiver have at least 100 memory channels.It would also be nice to have a preamp,atenuator,RF Fine tuning,and a Selectable AGC.I really like the Specs of the Grundig Satellit 700,but I've seen some postings saying that it is only a FAIR radio.Any information that you could
give me would help.

Thanks,
Joe Gallelli

You're correct...that's exactly what is happening, the cell tower sends commands to the phone that you hear as that bsst bsst and then poof, gone! Sometimes is you search around you maybe able to pick back up on the same conversation on a different frequency. Enjoy your new scanner.

Cliff

CI-V is FASTER..than RC network mods
AND....
Tap into the UNUSED MEMORY of your R-7000 and get another 99 Channels!

The R-7000 can scan quite a bit faster than the Scan Oscillator mod can provide
If you use the CI-V interface and a personal computer with serial port at 10780 Baud. The CI-V interface is a simple RS-232 to 5 volt interface in which the
Transmit Data and Receive Data are tied together at the 0to5 volt side (R-7000 side) and goes into the R-7000 via an 1/8' phone jack. If you want to check for squelch break use the Reed Relay output for this. Just make it toggle the RS-232 Bell line. You can have the R-7000 scanning in no time at all. Just use the code for Setting the comm Channel. Then Set_Channel( ) from 1 to 99 as fast as you can go! Eventually you will find that the PLL cannnot keep up. BUT THIS IS THE TRUE LIMITS OF THE R-7000! And Believe me it IS FASTER.

You will need to contact Icom for the CI-V protocol spec..They sent it to me free!
(Since I have just ONE radio and didn't need their multi Radio interface) Once you
have functions written in C, Pascal, Basic, or Visual Basic (Using the Protocol) for Setting the Mem Channel, Detecting Squelch Break. You can also load/save all 99 channels to disk etc. I have routines that call these functions to search the
Cell band at 825-846 and then automatically add 45 Mhz and switch upward ..when someone is heard nearby. I can scan the Military Band using a priority scanning method that I am unwilling to divulge which enables me to increase the effective scanning rate by scanning smarter. (Think about it) There are a few software/Hdw packages available but these are VERY LIMITED and DO NOT allow you the flexibility and power that a home brew system will. Most of these programs are just glorified Data Bases! Use Microsoft 'Access' if you need a data base. You'll find it's not as much fun as simply saving ASCII files of your Hottest Setup from the radio. I can have the whole radio saved and reloaded in under 1 min.

ALSO DID YOU KNOW that you can DOUBLE THE MEMORY CHANNELS?
You CAN! An R-7000 comes with half the memory UNUSED! Check out the Schematics. You will See that the Address pin A-10 is left grounded (Pin #19 IC-8) on the LOGIC BOARD. Ask for ICOM Tech Bulletin which describes this.
Just lift this pin off ground through a 5K pullup.Using an unused front panel switch such as the REMOTE PB and (A reed relay contact) you can BANK

SELECT another 99 channels. Great if you have (2) hobbys. Say:Military by day/Police Fire, Care Flight Air Care by night perhaps.

Enjoy!

Hello all!

I have just started reading this newsgroup. Recently I bought a radio shack PRO-2022 from a friend who found it at a garage sale for $6, but with no documentation. Operation seems pretty straight forward (I've had a BC-100XLT for a few years) but I'm wondering 2 things: 1) is this a pre-mandated cell block radio? 2) are there any cool mods besides cell block to do to this radio? I'm interested in opening up the rather limited coverage, mostly to get the 200-300 Mhz range. Thanks in advance for any replies. If it's possible, could respondents please email me with replies, in addition to posting them? I think my usenet reader is kinda spotty. Thanks again. John

1152. America's Airwaves announced

Newsgroup: rec.radio.scanner
Date: 1996-01-14 00:00:00 UTC
From: bkobb@newsignals.com
Message-ID: <bkobb-1401961200550001@bkobb.ppp.nova.org>
Source record: 242497

New Signals Press announces America's Airwaves,
a comprehensive wall chart of the U.S. spectrum
above 30 MHz.

Unlike any other chart now available, it includes
annotations for each of more than 300 bands VHF
through EHF.

Info and illustrations are available on the Web at:

http://home.navisoft.com/nspi/chart.htm

>crappy 800 to 400MHz converter<

You're some genius. It just so happens that the 3000XLT has no Track Tuning above 760MHz, so even if you could restore 869-894MHz, you'd have to hit the SRC button around 5 times each time you'd get near a busy channel. Since there's Track Tuning in the 360-385MHz area, the Cellular Security mod should be excellent. Better to have Track Tuning than to know that you're on 874.33MHz (which is kinda useless info).

If you must have the 869-894MHz region, buy the overseas UBC3000XLT from Javiation.

You're right....it is amusing....AND....educational. A few people
have commented on "how much" they've learned about me. The ironic
thing is.....it's a two way street. More irony is that you learn
more from an initiator than a respondent.

It's cool though. All except the malicious lying. I haven't found a
real good perspective for that yet. Malicious lies, like those
perpetrated by our dearly beloved Messrs. Moss, Smith, and Peter
Breath.....are out of the easily tolerable realm of name-calling.
Hell, I don't care what I am called, though, other than "late for
dinner", which pisses me off immensely.

Anything else is probably ok. :-)

Bill

That would seriously limit their market. It would not be legal
to purchase such a unit for mobile use in several US states, including
New York for any vehicle that fits the radar detector ban limitations, or
in Ontario Province. I don't think they would make such a poor marketing
decision unless they were totally unaware of the fact that radar detectors
are becoming very unpopular with legislators.

I believe you'll find the actual frequency for WNBC-TV's engineering & IFB
is 450.3875. What you received is an image, i.e. 450.3875 + 2*10.8 = 471.9875
where 10.8 MHz is the i.f. of your receiver.

Im hoping somebody can help me find a copy of the owners manual for the Regency MX-7000. I have been told that the MX-5000 model was basicly the same unit. Any information on these two scanners would be very welcome.

Also, does anybody have any active Military Freqs. for 225-400 MHz range around the Dallas - Ft. Worth area.

Best Regards,

Mickey D.

1172. Pro-35::A Mod To Stop Back-Light From Timing Out??

>Scanner Report'. I found it on several ftp sites. I think its a fair and
> accurate appraisal of the newsletter. I dont know who the author
> is or where it was originally printed. I pass it along for your information.

My fine feathered Peter Breath - you should feel proud of such a community service! There are three inconsistencies with your opening paragraph above, though. If you're going to perform community services, it is very important that you get it right. Do consider:

1. Your " repost of a review" is from an unnamed source. People like to KNOW who thinks what. Otherwise, the credibility of the offering is weak. Name the author.

2. You have never seen the World Scanner Report, so you can't possibly "think its a fair and accurate appraisal". You just performed osculatory services on your Boss's patooty is all.

3. Come now, my dear Breath, you speak with forked tongue when you say you "dont know who the author is". You *know* it was written by your good Boss Moss whose merest wish is your command.

But all in all, good job, my dear Peter Breath, good job. Not great, mind you. A great smear job would'nt tell any lies and wouldn't be so brazenly negative as your Boss Moss's "review". You see, the World Scanner Report has a circulation into the 4-figures, which strongly shadows your Moss Boss's veracity.

Oh, and it's especially "cute" where your Boss Moss snipes "how he'd do things better...." heh heh heh....which makes me wonder why you and HIM don't just get together and put out a BETTER product? The funny part is that neither HIM nor you do *anything* artistic aside from smear shit around. That's kind of funny (shitpainting). :-))

But seriously, my dear Peter Breath, <stifling the mirth>, how's come you and your Moss Boss don't ever do anthing that's constructive? I should think you and him could crank out books and newsletters galore to make me sit up and take notice. You know....REALLY run me off? That would do it, you know. But watching you two fingerpaint with shitballs is plumb downright funny....I couldn't run if I wanted to.

>>MVT-7100. It seems that the batteries are loose in the battery compartment
>>and when they shift around all of my remories are reset, wiped clean!!!

I had a similar problem, and it was indeed loose batteries (sort of).
The spring contacts whicfh press against the batteries don't have much
spring to them, and this is the cause of the problem. What I did to
solve it (and it's been successful for about a year now) is to cut an
appropriately thick slice from one of those "click" type erasers (you
know the ones - a refillable "mechanical pencil" which has an eraser
instead of lead - forms a rod about 1/4" thick. I put this behind the
contact, and it has stayed in place now without a problem.

Hope this helps!

1190. Modify your R7000 to scan & search faster

Modify Your ICOM R7000 to Scan and Search Faster

Copyright 1986 by Bob Parnass, AJ9S

This article describes how to increase the scan and search speeds of the ICOM R7000 receiver by 60% without noticeable performance degradation.

Background

The front panel SCAN SPEED control on the R7000 receiver allows the user to adjust the speed of scanning and searching operations, as well as the rate at which the priority channel is sampled. Rotating the control counterclockwise decreases the speed, and rotating it clockwise increases the speed.

When the SCAN SPEED control on my R7000 (serial number 001400) was turned fully clockwise, the radio would scan a maximum of about 8 channels/second, or search about 8 increments/second. As the following table shows, the stock R7000 can scan about as fast as a Radio Shack PRO-30 or PRO-2003.

Table 1. Maximum Scan Rates of Selected Receivers

Scanner	Maximum Scan Rate (channels/second)
Kenwood TR-2600	1.2
Radio Shack PRO-30	8
Radio Shack PRO-2003	8
ICOM R7000 (stock)	8
ICOM R7000 (after modification)	13
Regency M400	13
Bearcat 20/20	15
Bearcat 300	15

R7000 Scan Circuits

The scan rate of the R7000 is determined, in part, by a simple clock outside the microprocessor. The front panel SCAN SPEED rheostat and resistor R18 (and other components in the LOGIC UNIT) control the speed of this clock. The clock output is connected to what appears to be an input port on the microprocessor. The upshot is that we can affect the scan rate without affecting the other chores performed by the microprocessor.

The modification consists simply of soldering a 470,000 ohm resistor across the leads of resistor R18 on the LOGIC UNIT circuit board.

How was the value of 470,000 ohms chosen? Experimentation with different resistor values showed that for values both above and below 470,000 ohms, the R7000 scan rate decreases. Not having the R7000 Service Manual, I assume this can be explained by the firmware within the microprocessor associated with the scan rate input port.1

Adding the 470,000 ohm resistor in parallel with R18, rather than just replacing R18, has a few advantages:

1. The modification is easily undone, returning the radio to stock condition.

2. The LOGIC UNIT board does not have to be removed, as would be the case if R18 was unsoldered from the foil side.

Making the Modification

Accessing this circuit board is not difficult, and involves the same steps used when installing the optional Remote Controller or Speech units.

Use a towel to cover your work area to avoid scratching the R7000 cabinet. Unplug the R7000 from the AC line, and turn the radio upside down. Remove the bottom cover by removing the 12 screws holding it in place.

Remove the 4 screws holding what ICOM terms the "partition panel". Pictures on pages 32 and 34 of the R7000 Instruction Manual show the partition panel. After removing this panel, the component side of the LOGIC UNIT circuit board is accessible.

Locate R18, a 270,000 ohm 1/8 watt resistor, near connector J5. You may wish to remove plug P5 from J5 temporarily if it gets in your way. Carefully solder a 470,000 ohm resistor in parallel with R18. I used a 1/4 watt resistor as it was the smallest on hand.

Reassemble the radio, connect it to AC power and antenna,
and enjoy.

In the modified R7000, the scan and search rates are still
adjustable using the SCAN SPEED control. With the control
turned fully clockwise (maximum speed), the modified R7000
scans at about 13 channels/second and won't miss weak
signals.

---

1. Perhaps the firmware polls the scan rate input port
infrequently. Another possibility is that the scanning
pulses interrupt the processor, and the interrupt
firmware is limited in its ability to process frequent
interrupts.

>I have a radio shack pro 2035 and I'm looking for any mods for it.

There's only 20-30 things that can be done to it, from S-metering to memory expansion. For memory, the 2035 uses an 8k x 8 SRAM. Exchange it with a 32k x 8 for 4,000 channels or a 128k x 8 SRAM for 16,000 channels. External addressing required to retrieve extended memory in 1000-ch Blocks, one Block at a time. Cool, though.

I'm looking for flight for life freqs in chicago area i.e. lifestare at loyola hospital.
If anyone can help I'd be very greatful.

Thanks,
chris22@wwa.com

P.S. If anyone living around chicago wants any help I'm more than happy to
I've been living and scanning in this area for most of my life, But I just know
found the news groups so I'm a newbie to the news groups here.
Let me know if I'm posting in the wrong area or somthing.

: do CW at speeds better than 35 wpm. Today, we have major problems with
: 5, 13, and 20 wpm.
: 73 de KB7ADL

Your comments point out the clear reason why code has little, if any,
relavence for today's testing. It is simply being used less and less,
it is no longer needed for any service outside the amateur bands and
it, therefore, no longer needs to be made a mandatory requirement
(beyond a 5wpm test for international treaty regm'ts.).

40 years ago everyone drove manual gearbox automobiles and everyone
knew how do to so...today we have major problems with drivers ability to
shift a stick shift....so what. If it isn't important to be sure
everyone that can drive must have the ability to use an outdated manual
gearbox, then why is it so important that every ham on HF learn CW at
13wpm to have access to the majority of ham HF frequencies?

>selectivity, but I'm not sure if he knew what he was talking about.

Triple conversion insures you don't pickup images of cellular on
top of 800mhz police bands. Cellular is the only thing I've seen
that is powerful enough to mandate triple conversion in a scanner.
Since many police are moving to 800mhz, its highly recommended.

1196. RS Pro-2021 Scanner Questions

Newsgroup: rec.radio.scanner
Date: 1996-01-14 00:00:00 UTC
From: Ted Milkovich <ted@ted.us.net>
Message-ID: <30F93447.69C6@ted.us.net>
Source record: 242680

I have a Radio Shack Pro-2021 Scanner. I wanted to know about 1)any mods for this unit, 2) is there a computer interface for this unit and what value is it, and 3) what is this unit worth for a trade-in/up?

Also, I haven't used the unit for months and it doesn't seem to pick up anything even when I put in the frequencies - any ideas? Btw, I did try a mod but the unit worked fine after it. Before when I tried to use the scanner, if I left it plugged in and on for a day, it would start to work. Any ideas?

On the mods, are there mods for 800, etc.

Thanks for your help in advance. Please reply via e-mail to ted@ted.us.net in addition to the newsgroup post.

Thank you,

Ted Milkovich

Yes, Mr. Orlowicz, you did THAT to me. Or tried anyway, to send 80
messages and several hundred Kb to my email box. If you persist in
that "spamming" and call upon others to do it, I can assure you of
trouble for your time and effort. ASK your postmaster, ok? :-))

You are not judge and jury, Mr. Orlowicz. Skip the messages you don't
want to read and let it go. Contact your postmaster for additional
advice......some very good advice, at that.

Traffic copter guy, John Phillips in Cincinnati, works for many of the major radio stations (WLW, WCKY, etc.) and uses 166.25 to send the traffic reports to the stations. However, the on-air personalities talk back to him on a different frequency. Anyone know what the other frequency being used is?

Thanks,

Duffy

1202. Re: UNIDEN WANTS TO KNOW....

Newsgroup: rec.radio.scanner
Date: 1996-01-15 00:00:00 UTC
From: Collier_Chun@ccm.hf.intel.com
Message-ID: <4ddqrd$90f@ornews.intel.com>
Source record: 242386

In article <4d1s50$lc0@bighorn.accessnv.com>, phenry@accessnv.com says...
>UNIDEN WANTS TO KNOW....

1. Ability to dynamically assign a bank number to a memory, so you can end up with say, Bank 1 being 10 frequencies, Bank 2 being 5 frequencies, Bank 3 being 8 frequencies, etc. My Icom R7100 has that ability by assigning memories "selector" numbers. Otherwise I end up wasting memories.

2. Ability to give each memory an alphanumeric label of around ten characters each. It's easier to twist the dial knob and see "FIRE DISPTH" than to figure out what 154.400 is. Most cellular phones have this feature, and it works well. My Kenwood RZ-1 has this feature, and it makes it quick and easy to use while driving.

3. Ability to use, say, PCMCIA FLASH cards to contain frequency information. I have a scanner hard-mounted in the dash of my truck, and I don't care to sit in there and program all this information in by hand using an awkward front panel user interface. Provide a PC program which allows me to use, say, a spreadsheet-style interface on my computer to load all the frequencies into a memory card, then just stick it into a slot on the front of the scanner--just like some of the navigational radios in aircrafts.

4. "Smart" scanning of trunked systems. I suspect that DSP can be used to circumvent the GE jingle on trunked systems by sensing when human audio ends, and pure tones begin.

5. DIN form factor. I like the ability to hard-mount my scanner into the dashboard of my vehicle so it integrates in well with the interior. Vehicles are getting more cramped, and mounting an underdash scanner, IMHO, looks out of place in a luxury vehicle. Again, the Kenwood RZ-1 is/was DIN form factor, as well as the Shinwa SR-001A

6. Squelch/recorder control port. I use this for multiple purposes, including, of course, turning on a tape recorder when a signal comes in. However in a vehicle installation, this could be used to mute the stereo when the squelch opens.

7. Ability to select from more than one or two stepping rates while in search mode. This means step rates of 1, 5, 10, 15, 20, 25, 30, 50, 100 kHz. (e.g Shinwa SR-001A)

8. An optically coupled tuning knob on the front panel. Use this to dial through the memories
or to manually tune up and down the band. Give us the option of engaging a click-stop mechanism on the knob, or disengaging it to allow a free-spinning VFO knob. Feel is everything. Use ham radio HF radios from Kenwood, Yaesu and Icom as examples.

PH>UNIDEN WANTS TO KNOW....

PH> Uniden wants to know what features you would like to see in
PH>their future scanning radio products and they have asked us to
PH>conduct a marketing survey for this purpose. Please leave your
PH>E-Mail suggestions here on the forum. They will be tabulated and
PH>forwarded to the Uniden Product Development Department on February
PH>1, 1996.

To make it simple.

1) CTCSS on more scanners, particularly portable scanners. There is no reason in the world that a shirt pocket sized ham radio can have both encode and decode, and a scanner can't have CTCSS and DCTCSS decode.

2) Although easier said than done, some way to follow trunking systems would be nice.

3) If a standard is ever agreed upon, digital modulation would be nice, since eventually everyone is going to go to this.

4) Smaller units, or units with separate control heads for use in smaller cars.

5) Better displays, better speakers.

* CMPQwk 1.42 129 *Talk is cheap because supply exceeds demand.

Patrick Miller (pmiller@nyx10.cs.du.edu) writes:
> What is "i.f."
>
> Hope I don't sound to dumb.

IF stands for Intermediate Frequency. This is the frequency your scanner actually tunes to receive the signal on any frequency. When you mix two frequencies together the outcome is actually four different frequencies. For example 10Mhz mixed with 12MHz would give you 10MHz, 12MHz, 2MHz and 22MHz. To give an example of your scanner, let's say you want to listen to a cordless phone on 46.63MHz and your scanner IF is 10.5MHz. When you tune to 46.63 your scanner produces a signal of 57.13, that mixes with the 46.63 signal from your antenna to give 57.13, 46.63, 103.76 and the 10.5MHz signal you scanner will filter out for reception.

I'm haveing problems whenever I plug in a AC adapter. I encounter noise
and I am unable to read / listen to anything exept for noise. My channels
won't even change manualy. Can any body help me out on this problem.
I am using a Uniden Bearcat. handheld scanner. If this is relavent.
Thanx for any help - Greatly apreciate it.
Chris.

Ability to lock-out frequencies during a search mode ie; search between
160.000 - 170.000 and be able to skip over the NOAA WX radio on 162.400
162.500 & 162.550.

Sub Carrier Audio decoder ie: several media trucks use 1 frequency but
have different audio available on the the sub-carriers ... KTRH/KLOL
houston use 955.550 and put KLOL IFB on 39Khz sub carrier, KTRH IFB on
67Khz and KTRH News on 92Khz.

I replied to Mr. Humphrey by private Email, where it belongs.
One thing must be corrected. The comment of the "Cops & firemen are lazy"
should have had quotes around it. It was my intention to give you the
impression of what the general public thinks when they cannot get info.
Alpha Pagers go off for dispatches instead of the radio,
status buttons are pushed for instant communications
no clear voice traffic = the concerned citizen to wonder what they hell
am I paying taxes for? They don't do anything, They USED to but they want
to scramble the talk, so what ARE they trying to hide.
I do not refer tocops /firemen as lazy. Most of them that I know would
lay their lives down in a second for a total stranger. Would you?

1216. Tech Question on Motorola Trunking

Newsgroup: rec.radio.scanner
Date: 1996-01-15 00:00:00 UTC
From: Joe Cardani <IE17n1l@TJUVM.tju.edu>
Message-ID: <4de7di$l2f@mail.TJU.EDU>
Source record: 242400

A few years ago, an excellent technical overview w
relating to how Motorola Type I trunking systems operated was
posted. From the posting, I understood the following:

On the system data channel, a "channel grant" is transmitted to
the mobile/handheld radio. This grant (or outbound signaling word)
"OSW" is sent twice in rapid sucession. IThe word s 84 bits in length
and is sent at 3600 bits per second.

It includes the following info:

1. Individual ID of radio
2. Fleet/subfleet of radio
3. Type of Call (individual or group)
4. Number of voice channel to be used (ie channel to switch to)

My questions are relating to this OSW: and are:

1. Is the above data transmission sync or async? If async,
are there any start or stop bits associated? If sync, what is the
best way to identify the start of the word?

2. Is there any parity or error correction included in the OSW for
the channel grant? If so is it at start or end?

3. What are the length and positions of the elements within the
channel grant osw? (eg. the radio id is the first
position and is x bits long , etc)

4. In addition, in the absence of the channel grant OSW 's ,
background OSW's are transmitted by the data channel.
How can I indentify these OSW's a
as well as the channel grant ones?

Thank you so much in advance. This information will provide
extremely helpful in my understanding of the system.

Joe Cardani

>> I'm new at this. Could someone explain to me what a mod is?
>> Thanks.

A "MOD" is abbriviation for MODification, someone who is looking for
a list of instructions in order to MODIFY their radio equipment, to do
all sorts of things, the most common mod is to the frequency spectrum,
for instance, a PRO-51 handheld scanner doesn't come modified to
monitor the Cellular Phone Frequencies, but with a MOD performed to
the radio, then it CAN now monitor cellular frequencies. Note: I used
the Pro-51 just for example, there is no CELLPHONE MODS available for
this scanner... Does this clear up your question?

> Does anybody know of a way to jam police laser guns ? Any equipment out
> there on the market?

There are a few places that sell Laser Jammers but only one will work.
The ARC Interceptor LZR is brand new and uses an actual laser to jam. The
rest use IR LED's and really don't work. About the only LED based one
that halfway works is the K40 Diffuser. It'll jam laser under 700ft but
if the laser is moved away from the plate the laser will most likely
begin giving readings.

Another idea is to use 2 or 3 Xenon strobes, strobe them at a fairly high
Hz rate and cover the with IR band pass filters. It should be enough to
confuse the gun. Use with a laser detector to slow when you get nailed.

It's manufacture date is 2A4...

I don't think the serial number ends in 'A'

I've checked oak.oakland.edu & see no mention of mods...

Anyone heard if this one is modifiable??

Please fwd copy of reply to my e.mail address... Thanx!!

>
>Anyone else using this? Had any problems?

For about $20.00, if you have a cassette player in your car, RS also has a device (also primarily for port CD players) which resembles a cassette & has a P/B head in it. It has a wire which plugs into a port CD player allowing it to play through the car stereo via cassette player. Buying a stereo to mono adapter (also from RS) & plugging iot into the ear jack of a HH scanner gives audio to all speakers in your car. Works very well.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 110 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be
complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio
worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a
mobile or base model. Portable scanners are subject to
more physical abuse and many have been dropped. If a radio
has been dropped, the laws of probability dictate that the
first point of impact was probably a corner, so be sure to
examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration,
dust, and temperature extremes. This shouldn't dissuade
you from buying a used mobile scanner, but be aware of
possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these recent scanner models in Monitoring Times magazine:

Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040

Note: Reprints of Monitoring Times articles are available for $2.00 each from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin

19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end

circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good

scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line,

overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack

crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane

keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or

scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed.

Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See review in upcoming Monitoring Times.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes

on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning.

PRO-26: Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. Audio suffers from small

speaker.

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the

common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal
Signal in University Park, IL, phone (800)524-3021.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend

reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two

companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), | and available from Grove Enterprises for about $30. A new, | 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall

security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an

outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $27.00 per year, which includes the monthly Scanner Journal, approximately 50 pages in 8-1/2" x 11" format. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. The RCMA web page is at http://comp.uark.edu/~plaws/rcma/. The RCMA | electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

All meetings are held on Saturdays at locations announced in advance. The next meeting is February 10 at the Destiny | Restaurant in Des Plaines, IL.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and
larger book stores for under $13. Police Call is basically
a computer printout of FCC license information in the fire,
police, local government, and conservation services in two
lists: by licensee name within state, and by frequency.
Later editions have included a few pages of local airport
and nonsensitive federal government frequencies. The 1996
edition contains selected business frequencies, too, but
callsigns are listed only for local government and public
safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local

agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information

fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 50 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA. The RCMA electronic | mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s]

missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Try the new scanner battery from Radio Shack. They came out with a battery that fits they're newer handheld scanners, it comes with a recharger (but you have to use your own AC adapter) for $34.95. I used to use the RS nicads and they lasted 4 to 6 hours, with the new battery pack I have not heard the beep that the battery is low.

1243. Question About Detecting Low-Powered Bugs

Newsgroup: rec.radio.scanner
Date: 1996-01-15 00:00:00 UTC
From: towarth@ix.netcom.com
Message-ID: <4deb1t$5a9@ixnews8.ix.netcom.com>
Source record: 242456

I am interested in locating inexpensive, low powered (typically ~35-75mw) Radio Shack and similar transmitters (some may be in VHF range, so tuning an FM radio wont do the trick) from a distance of _at least a few feet_. Tried an Opto Scout, which was unable to detect a Radio Shack FM Wireless Microphone (Model 33-1076) until it was less than _one inch_ from the unit, despite the low background in this rural area.

People have suggested the Opto Interceptors (R10, R20) and models made by Viking, REI and Kaiser. Any feedback on these units would be appreciated. Does anyone know if the Interceptor R10 would be capable of detecting such a bug at a distance of several feet? The unit's ability to demodulate FM signals and relatively low price is a plus, but it is of no value for countersurveillance if one has to be within an inch of a transmitter--which is the case with the Scout (btw, the Scout's signal strength bargraph didn't display even when the antenna was touching the RS unit, though the red light and beep tone were awake and the frequency was accurately displayed. The bar graph does work well in proximity to a cell phone or walkie talkie. Is the signal strength meter more sensitive to 35-50mw devices in the Interceptor?).

I would appreciate any feedback by email or post on the suitability of units under about $500. capable of detecting these low powered devices from a least a few feet, and the Interceptor units in particular.

Thanks very much in advance,

TW

Hi all. Anyone know the new frequencies for the West Allis, WI Police and Fire on 800 MHz?

Also, I'm thinking of buying an 800 MHz scanner. What kind of range do 800 MHz transmitters have with normal power? (i.e. I guess I'm asking if I'll be able to hear the mobile units 5 miles away with an indoor antenna.)

Thanks much
Mike

I used to own a Pro-2006 but sold it many months ago when I was reloacted to Canada. Now that it looks like I'll be staying here a while (engaged to be married!) I've decided to get back into this "hobby" (obsession?).

The local Radio Shack has a new Pro-2040 100 Channel model that seems pretty good so far (bought it on sale with the standard RS return policy). They also had an older Pro-2032 200 channel model that was only about $50 more expensive. Are there MAJOR differences (other that 100 more channels?). Is either one more modifiable? Better?

Please e-mail to LarryR@Chancery.com as my news "reliability" seems to be spotty.
Thanks!

I recently received my grandfather's old police scanner and I am finding
it very interesting. However, I recently moved to Ottawa, Ontario and I
don't know any frequencies or exactly how to work the darn thing.
I figure I can probably figure out how to work it on my own.
But what I would really like is if someone had a list of frequencies for
up here or how info on how you go about finding them out...do stores like
Radio Shack have them?...would a government dept. have them?...is there a
FAQ list around that would answer some beginners questions? It would be a
big help, Thank you.

>Hmmmmm? Doesnt take it seriously? Excuse me...?

You'll know the definition of "serious" if you go sending me any more
of your sexual come-on messages. Won't be any litigation to it. No
threats, either, you nescient offspring of a mass Siberian syphiletic
gang bang. Get your head out before you fart and blow your brains
out, Clingberry or Peter Breath, whatever your current name is.

Oh.....by the way......you forget.....AOL doesn't NEED to have its
security "cracked" in certain instances. They can be *very*
cooperative at times. Nice folks, AOL......

Gerald Schmitt (kc5egg@ix.netcom.com) sniveled thusly:

> I never suggested to should not defend yourself but rather suggested if
> you took a more well reasoned less hostile approach you would engender
> more respect. The suggestions were meant to be constructive apparently
> you missed that

Of cardinal importance is that you can't understand that I
did not solicit your thinly veiled threats.. 'er, "suggestions".

>>Oh gawd, here comes another threat now....

> There never was any threat except perhaps in your own mind.

Geezus, fella, you followed that up with laying on me how I'd
lost your respect. If that ain't leveraged force, I don't know
what is.

> I thought you might have some interest in hows your readers
> (customer base) viewed this diatribe. I was wrong sorry.

Are you stupid? Or do you just ACT the role? This is NOT the
forum for business-interaction with readers and customers. I
understand it is a hobby forum. I am a hobbyist. I feel I have
no right to suggest what you do with that wart on your nose, and
you damn sure have no call monkeying into my business. 2-way
street, fella. All the way.....

> As I read down your needless and senseless post, the image I had
> of you shot like a rocket down to cesspool level. Two way street, man.

> I am stumped by this outburst.

Gawd, another communications gap..........

> Someone gently suggests to you that your position would be better served

Someone? Who? You? Who asked for your lewd, intimidating,
anything-but-gentle "suggestions"? Is there some other asshole
on this forum using my name? Pay attention, fella: I am trying
to tell you that if and when I am in the frame of mind to entertain
your suggestions, I will ASK for them..... probably the same as
you would do, were you interested in my suggestions for the
betterment of your life.

> My only motive was to suggest a better way for you to present
> your position so people would listen rather than blow you off.

Gadfrey, dude, are you a damned nincompoop and incapable of
understanding plain Queen's English? I thought not. THAT's
why we go to street level 'hood English. Surely you have to be
able to understand that I am not here to present a position;
that it is inappropriate for me to come here to present a
position; and that I don't give a screaming horseturd what
you think about me; my Great Aunt; my dog; or my main business
of sales & marketing of oversize condom rubbers for the over-
endowed. How can I impart this to you?

>>. I know my respect for you has been diminished
>>and I am sure the respect of others has also.

And THAT, my dear fellow, speaks loudly for itself. You
opened fire with that imbecilic statement, speaking for
others, when you can marginally speak for yourself.
Geezus H. Kriste, your density is exceeded only by that
of Uranium 238, I think.......or is it Nobellium?

> It is my opinion and I'm afraid you can't bully me out of it. Sorry.

Quite all right, fella. Opinions are like assholes. Everybody
has one and they ALL stink. Why don't you treat your unsolicited
opinions LIKE your sorry patooty and keep 'em to yourself? Or,
do you offer your pooper around like your opinions?

>>Equality. That's the way it is supposed to be, right? But that's not
>>how you stupidly come off......trying to leverage your respect for me
>>into some sort of a power play in a totally unrelated business matter.

> It is not unrelated if you engender disrespect in your customer base
> you have no customer base. Not unrelated at all.

Aaarrrrgggghhhh! Psssst! Hey buddy, take the condoms off
your ears and listen a minute. "Customer bases" have no basis
for being a topic of discussion here. STOP right now, trying
to leverage that crap on me. If you don't STOP, I will START
leveraging something on you......starting with your gene pool
that has a very short ancestry back to the common urinary ant.

> Again only trying to help.

Would you like MY help with straightening out YOUR life?
Remember the good words from the good book: "Do unto others...."?

> Answering all the verbal outpouring above is futile.

Ahhhhh......are we making headway.....?

> My original intention was constructive

Shit! Shit!

Sorry, you had my hopes up for a minute. Hey, I have an idea
....would you like some constructive intentions from me? No?
Remember now..."Do unto others......"

> I see now there is no room in your Neanderthal brain

You are definitely taking a circuituous route to great Wisdom
at long last.......... Perhaps the flash of the Great Aha! is
about to enfold and penetrate your sightless eyes....

> for constructive criticism.

When I want it, I will go to REC.CONSTRUCTIVE.CRITICISM and ask
for some.

> As to making a fool out of you there is no way anyone could do it

Ahhhhh......at long last.........headway.

> as well as you do.

Geezus.....dashed hopes again..........

> Just as cursing demonstrates a lack of vocabulary

Do I detect an offer to wager on the depth, breadth, and height
of our respective vocabularies, with something of substantial
value going to the victor?

> Prove me wrong

I came here first foremost to prove something of keenest meaning
ONLY to certain lying, conivving, treacherous, sonsofbitches of
the lowest degree. I came here NOT to prove anything to you,
and I am not beholden to try, UNLESS you are of the genetic strains
of those with whom I came here to deal. If so, then announce it
and you will have your proof.

Otherwise? Butt out.

When my first order of business here has been completed, then
I shall turn to a more ordered, better layered operating level
that best suits the purposes of scanners and scanning. At that
time, Mr. Schmitt, you will want to prove something to me.....
that this little distracting interlude was due to a tremendous,
massive brain fart between your ears or some damn good excuse
for this exercise in utter imbecilic idiocy for which you had no
prior investment or invitation or provocation.

1257. Re: Triple Conversion - Why Better?

Newsgroup: rec.radio.scanner
Date: 1996-01-15 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <4ddu9o$eca@news2.cts.com>
Source record: 242470

lui@netcom.com (Stephen Lui) wrote:

>Why is Triple Conversion better than Double or Single Conversion?

Single and dual conversion are not capable of rejecting image
frequencies that are generated as byproducts of the heterodyning
(mixing) process. Image frequencies = desired freq + and - 2(IF freq)

Triple conversion has the effect of placing the images far outside the
passband of the 3rd IF section, thereby eliminating them for all
practical purposes.

> A salesperson at Jun's Electronics in Culver City told me that Triple Conversion
increases
>selectivity, but I'm not sure if he knew what he was talking about.

He didn't. Triple conversion has no inherent impact on selectivity.
It could.....by design....but it is not automatically so. Sales
people tend to run off at the mouth and would do well to post the
below sign in a conspicuous place:

"Samson once slew 10,000 Phillistines with the jawbone of an ass."
"Each day, 10,000,000 sales are killed with the same weapon."

Bill

Simply cut one or both ends. If you only cut one end, and slightly seperate the two ends you can resolder if necessary. Be CAREFUL! If you have to ask a question like this one you should probably get some help before you go inside your radio.

A strict observance of the written laws is doubtless one
of the high virtues of a good citizen but it is not the
highest. The laws of necessity, of preservation, of saving
our country when in danger, are of higher obligation.

Hi there, Came across a nifty little toy for the scanner the other day. It's called a Sound Sender. What it's
basic use is to plug in the head phone jack of your portable CD player/walkman and then listen to it thru
your car's FM stereo. Trying to listen to my scanner in the car thru it's own speaker is less than perfect, but
with this gaget I just plug it in, tune in the Stereo and out it comes loud and clear. I found it at K-Mart
for around $30 cdn.

Anyone else using this? Had any problems?

Take care

Kevin

*******"Whats for dinner" ?

Well... Before all the hoopla and laws governing such listening I
would say that my scanner stopped on a few cellular calls now and then
that were VERY intresting at the time. That was also the time when
folks were being told by ignorant sales representitives that their
communications were also secure. (hehe)

Most however are businesses doing their business or spouses calling
home to see if anything is needed from the store. I imagine that if a
person were to listen long enough in that band you might catch a few
amusing or intresting conversations.

Just remember that technically it IS illegal to do just that.

Um, here's a silly question...

I have a Sony SW-1S. Can I listen to these shuttle rebroadcasts? I
think I need a BFO, correct? And my little radio doesn't have one!
AARRRGGHHH!!! Perhaps I'm wrong, and I'm just not recieving the
transmissions? If I can't get this stuff with my radio, I'm gonna get
ticked at the place that I bought it from for telling me that I'd almost
never' need a bfo!

My database has over 25,000 freqs for Chicago alone, and more for nearby suburban areas. I'll suggest that you attend the next meeting of the Chicago Area Radio Monitoring Association (CARMA). It will be on Saturday Febuary 10, at the Destiny Restaurant, 1440 Rand Rd (US12) in Des Plaines IL. The meeting starts at 1:00 PM, and lunch is at Noon. The only cost is for your lunch (required since we get the room for free).

Talk in is on 446.050 or 145.770.

Local scanner freqs are: DP PD 155.745, DPFD 154.340, UP/CNW RR (visible from the restaurant) 160.485.

For more information, E-Mail me at RCN9JIG@aol.com.

Also, the CARMA Newsletter is available for $15.00/yr (6 issues) from Kim Moran, PO Box 2681, Glenview IL 60025. Please make checks payable to "Kim Moran"

Yep, most cops around here have cell phones and use them when they don't
want everyone listening to whats going on. Thats exactly the stuff thats
good to hear;-) Not that I've done it but thats what I've heard.

Yes, Me and Mr. Humphy are actually above speaking terms, he even invited me out to LA to see LAFD firsthand all expsenses paid (just kidding) as long as I pay them.
For those of you that have not visited the LAFD web site, go there, it's pretty neat, and they post their 800 NON TRUNKED freq. for you to listen to.
Also check out the Charoltte NC web site.

Television.
Many scanners don't cover these frequencies because they are allocated
to UHF television. Not very interesting (even if you have a TV).

I have just purchased a scanner equipped with a pl tone board. I was wondering if anyone would happen to have the pl tones to the following State of Iowa frequencies:

155.430 Iowa State Patrol CAR to CAR
155.445 " " " CIS
155.505 " " " AIR
458.700 " " " Portable Ch
458.625 " " " Portable Ch

155.595 DNR Car to Car

154.920 DCI "Purple" Car to Car

155.970 IA DOT MV Enforcement

Would appreciate anyone's help on obtaining the pl tones for the above frequencies. It would be much appreciated!!

Thanks in advance!

As someone who has spent a qhile doing freelance photo work, following
the police, fire, etc.around in circles, I can tell you the following:

If it is on the air, in the clear, it ain't that important.

The lagl balance is your right to know versus their right to make it
safe first. Digital is more effecient, uses better bandwidth, and is
normally clearer. It meets most (not all, for sure) of the needs of
the people who need the radios.

You can't scan them? Too bad. you ain't first in line.

- Alex

I suggest that fourty years ago you had a lot of ex-military operators occupying the amateur ranks. Since these guys did nothing but listen to Morse code for eight hours a day for years at a time, it's no wonder they could copy at 30+ wpm.

I have one Regency MX-5000 that I'd be willing to sell. I have the:
Radio, Back of set antenna, and Power supply. A speedup mod was done to
the radio so that it scans faster and I performed the mod myself which was
just replacing a simple resister. The radio also has a Hold Frequency if
it detects a signal while in the search mode. The scanner is in excellent
condition too! Now that I think about it, I may indeed have the orginal
box but I'll have to look around a bit to find it. ->Dan

1297. Re: Opto Scan vs. Star Tek?

I trust you are referring to the OptoElectronics counters... I'm not aware of any OptoScan counters. Opto-Scan is the name of a scanner control board, also made by OptoElectronics.

I don't know much about the STARTEK counters, though I have seen them at HAM shows and such. Do all the STARTEK counters still use LED displays? If so, they will suck-up more power than LCD counters.

I have an Opto 3300 mini-counter. It works pretty well, but I have to change switch positions if counting over 250Mhz... above that the measurement is considerably slower. Under 250 Mhz, it's plenty fast though. I wish it had some serial data out feature.

I'll probably be getting a SCOUT soon, but that's not a cheap proposition if cost is a concern.

It's not much information, but I hope it helps!

I am interested in why people go to great lengths and modify their scanner to eavesdrop on cellular conversations. Is there anything interesting that people talk about?

I am happy listening to the aircraft, railroads and police and fire dept.

Why would somebody go through the time to unsolder and resolder their scanner to hear somebody's conversation? Do people talk about more than "Whats for dinner" ?

>Take care

>Kevin
>Vancouver B.C.

I use the Radio Shack CD accessory that plugs into the cassette tray of
an auto's stereo connected to the scanner's headphone jack. Works great.
It's $19US. The one you speak of is FM(AM?) signal based I guess. What
type of power source does it use? (Batteries or leade?) How far away can you
pick up the signal with say a walkman?

One REALLY nice thing I've been playing with lately is the 900MHz cordless
headphones (Optimus brand RS sells ~$99US). This works excellent around the
house/yard & a 1/2 block away (outdoors when transmitter is in upstairs window).
The headphone's frequencey (adjustable range 912-914MHz) doesn't conflict
with 900MHz telephones. It uses an *18* volt 150Ma ac transformer for the base,
though I wish it was 12v for easy field use out of an auto. The headphones
house a battery, looks similar to cordless phone pack from the diagram.
It would not make for convienent field change of battery because access uses
3 screws under the muffs. Charger is part of base/transmitter. Charge
lasts about 4.5-5 hrs with volume on headphones rather low and the transmit
volume higher to suit. There is no balance control. Comes with mono to stereo
plug, patch cable and headphone charging leade.

Specs say:

Frequencey Response 50Hz - 12 kHz
S/N Ratio 60dB
Stereo Separation 30dB
Distortion <2%
Operating Range 150ft(open field)

> his the most knowledgable scanner geek in the world, it would seem that he
> has a rather large debt to pay to other, perhaps more creative tinkerers.
> Stay tuned......
>
>>>>

It is entirely possible that two or more people have independently discovered a few secrets about a specific radio at approximately the same time. Given the proliferation of scanner radios and the abundance of technically sophisticated "creative tinkerers" this is entirely
plausible. Take for example the creation of Cubism in the early 1920s. Pablo Picasso and George Braque each reached the same conclusions and pictorial vocabulary within days of each other, yet neither knew of the existence of the other. This makes it _very_ hard to prove someone has borrowed substantial material from other sources.

I have watched, read, and learned much from the postings over the last two or years or so in this group. I've learned that Mr. Cheek does not have his head up is ass, he is quite skilled in his research and presentation of those results, he will defend himself when irresponsibly attacked, and you appear to be immaturely jealous of Mr. Cheeks technical ability and accomplishments.

Just in case you think I happen to be a little unskilled in electronics and "really don't know
what I'm talking about," I hold an Amateur Radio Extra Class License, General Radiotelephone
Operators License with Radar Endorsement, NABER Certified Two-Way Radio Technician, and am a Certified Electronic Technician with a Journeyman Rating. I've been a technician for the
last twenty five years working on high powered transmitters (40kw), radar, computerized measurement systems, and even mundane things like televisions, stereos, cd players, ham radio and cb equipment. I think this persepective enables me to appreciate the effort and achievement of Bill Cheeks work with scanners.

Apparently you are under the misconception that you and Bill Cheek are the only people in the universe that have access to scanner radios and that your omnipotence as a scanner god is threatened by Bill Cheeks existence. You should be. Open your mind a little bit, and you might learn something from your betters. Otherwise, retreat into your selfmade delusions of superiority and consume fecal matter and perish. No one will miss you when you're gone.

1310. Re: MOTOROLA Cordless Phones - simple inversion?

Newsgroup: rec.radio.scanner
Date: 1996-01-16 00:00:00 UTC
From: prografx@teleport.com
Message-ID: <prografx.672.00008A93@teleport.com>
Source record: 242348

Voice Inversion is not an outdated technology, it is just inexpensive and a reasonable first step in rendering voice communications unintelligible to the casual listener.

Digital is expensive, although much more secure. If enough people would pay $1500 for a cordless phone just to get this level of protection, then someone would be selling it.

Time Domain encryption is a nice balance between Digital Encryption and Analog Inversion Scrambling in terms of cost and security, but it too costs more than Joe Q. Public is willing to pay for the privelege.

Also keep in mind that both Digital and Time Domain technologies are NOT real time. This means that to have a usable full-duplex system, your acquisition and processing time is so short that you must make the system simpler to decode just to keep the time-delays down to the minimum acceptable to the target audience.

There have been some systems that combine simple Time Domain Encryption with Inversion Scrambling, and they are much more effective in a security sense than inversion alone, but the costs are significantly more to the consumer, who generally finds simple inversion or dual split-band inversion good enough, and cheap enough.

>Any other suggestions?

Yes, don't get so worked up over it. The only reason modifications are popular is because the "forbidden fruit" is so relatively easy to obtain. The minute that you try to "outsmart" the new designs, it requires facilities, equipment, and talent that most of the people here do not have access to.

It is much easier to ferret out an older instrument than to "hack" the new ones. Is it really worth all of that effort? I am sure cellular communications are a lot like Police/Fire/Air communications....most of it is banal, boring, and pointless to you, but every once in awhile it is highly entertaining.

The other services are not technically illegal to listen to, and no mods are required.

I built Bill's Data Squelch circuit, and I found it to basically be effective
(when adjusted properly) in bypassing trunking-control-channel type signals,
and less effective (of course) on "bursty" signals like ACARS (which are short
anyway) or mobile data terminals.

Additional filtering may indeed help improve performance, but it seemed to
work as advertised for me. Part of it may relate to your expectations and/or

understanding of what the circuit can and cannot do.

>Thanks.

Most of them are either recently discontinued, or they were discontinued last year after the change to the ECPA (April 1994). Many "older" (restorable) models were still out there in the distribution chain, and it has become a "game" to locate them. The thrill of the hunt, so to speak, and definitely no longer in the catalogs.

Although a discone is a good antenna for a scanner (as well as some other applications) mounting it INSIDE AN ATTIC may cause it to behave poorely. Also 85 feet of cheep coax can eat up nine tenths of your signal. Keep your coax as short as possible and look at the loss figures for the coax before you buy it.

From: archer55@aol.com
Message-ID: <4dhqet$khc@newsbf02.news.aol.com>
Source record: 242358

>> For all of those looking for POCSAG decoder, please keep in mind that most all alphanumeric paging uses GOLAY (not POCSAG) nowadays.>>

Incorrect.

Golay is old news, and will probably cease to exist in the US by the end of the century. PageNet and MobileMedia, the two biggest paging carriers in the US use POCSAG for almost all alpha paging, and are just beginning to use FLEX and REFLEX. The majority of Golay pagers in use today are tone-only, and digital.

The simplist inversion.
There is a company in Nebraska (Transcript) that makes an inversion
scheme for cellular that jumps the center frequency around. Good luck
with this one!

Motorola cordless
.....and guess what else? You can use the ^ phone itself to descramble
conversations picked up on your scanner! (Not available on all
models, of course.)

The Interceptor RADAR jammer was said not to work in Automobile. But,
theres a big controversy brewing over Automobile. Apparently their tested
is fairly biased and has judged BeL detectors over ValOne, but the guy
also received a "consulting" fee from BeL. Theres much more to it but One
wonders how accurate these tests are. They also tested the Phantom which
is just a copy cat of the Stealth VRCD. It was tested by Car and Driver
and it worked, Automobile said it didn't. I personally have seen the
ARC Interceptor work against a K-55 and various Radar reader boards. I don't
work for them and I receive no "consulting fee" I just tested it the way
anyone else would, drive, get zapped, ask for results. I have a friend
whos a cop and he was pleasantly surprised, quote "If I wasn't a cop, I'd
have to get one of these." He uses the K-55 almost everyday so I think
he'd be apretty good judge of what works. Go to my homepage for the review.

As for their laser jammer, think about it, what would jam a laser better
than another laser? And since LED's haev shown marginal effectiveness, a
Xenon strobe would tip the scales. I haven't seen their device so I can't
really say if it works, but, from my personal experience I'd bet it
works. They've been in business for over 2 years so they aren't a
fly-by-nigh co.

1335. Re: Sound Sender for Scanners

Newsgroup: rec.radio.scanner

These devices also draw a tiny fraction of the power that a scanner's speaker draws when turned all the way up (the normal mode in a car). This allows your scanners batteries to last multiple times longer.

I recently bought 2 of them from different sources. The first I bought from someone online and got radio (with battery and antenna), charger, leather case, and manual for $140 (included shipping). I liked it so much I went searching for another and found one at a pawn shop. This one was radio, battery, and antenna only. I paid $85 for it. Both were in good to great condition and had full 800MHz coverage.

Online, I have seen a number of 200XLT's advertised anywhere from $125 to over $300. Your mileage may vary.

Also, awhile back certain Wal*Mart stores here in the midwest had the 200 on clearance for $179.95. My father bought the last one in the Wal*Mart near his home. Also, a liquidation company called DAMARK has been "rumored" to have some factory reconditioned 200's for around $175.

Hope this helps in some way.

You can hear lots of interesting things.
Many of the conversations are funny becaue someone is pissed off and
swearing his head off. Fights between husband and wife,
girlfriend/boyfriend. Transfers of money, stocks etc.
During the day mostly business calls, you can get the tips on where to buy
the latest computer gadgets for the best price. All kinds of
useful/useless information. In the evening it's like a soap opera, you
peer into the lives of real people instead of watching the tube. I'd say
it's good wholesome entertainment.

Your words......not ours. :)

I might add...most of the rift between "classes" is... many of the
beginners' utter contempt <jealousy?> for those who have "earned" a

ticket containing more privileges. I see a vastly greater number of beginning class hams complaining about the more experienced class hams than vice-versa.

Instead of asking for help, now everyone goes on the defensive. Is it a crime to admit you don't know something and need the help of someone who has more experience...someone who has labored through the books...through the trial and error...?

Used to be the more experienced class hams looked forward to helping the new folks out in this hobby. They were and still are called "Elmers." It seems, though, that the new class of license comes with an attitude now. "I know my stuff <at least I'll act like I do> and I am not going to let anyone tell me differently...no matter how incorrect or misled I may be."

Luck Hurder, KY1T, once said <and I paraphrase>, "This is a very loud form of communication."

Anything said over packet, Internet, and like media has the reader's undivided attention. You can take anything said via this forum and it will be amplified many times over in the mind of the reader...moreso than in face-to-face conversation. Emotions run high as we are so quick to say our piece without giving much thought to its content. Our egos demand that we say our piece as if ours is the only one that matters. Who cares what the next guy thinks?

Some of the language used in this perpetual battle between "the haves and the have-nots" is proof that we have a lot of growing up to do. It amazes me that many of us got into the hobby because it was fun (some of us have been doing this for the majority of our lives) and for many the fun has gone by the wayside. They remain however.... and all their efforts are focused at taking the fun out of the hobby for those who nurtured it to where it was before its knees began trembling.

Many could care less about the hobby anymore...many are scared away from the it...and for many, the only thing they care about is all they can get with a minimum amount of effort...to the detriment of amateur radio.

Now a question....if the hobby is that bad...why are you still in it?

WK1V

HAM RADIO CAN STILL BE ENJOYABLE!!!

P.S. This ham is no better than the next. If you want to elevate my status that is up to you..it is not necessary. I have only been a ham for 15 years..obtained a Novice ticket <KA5MWD> because I wanted to. SWL'ing intrigued me to the point that I wanted to talk around the world.

I operated CW-ONLY for the first year and upgraded from Novice to General <N1CLS> because....I wanted to. I did what was required of me to obtain the higher ticket. Then I upgraded again <KB1LW> because... I wanted to...to get almost twice the frequency privileges. I was having a ball on amateur radio. I told myself that when the first call area got into the "W" two by one calls that is when I would upgrade to Extra. That is what I did in 1990. <WK1V> I didn't do this to be better than anyone. I could care less about anyone else's hang-ups about me being better than them or vice versa.

If it wasn't for the Extra Class or Advanced Class or maybe even the General Class ham that attended/administered the VE session where you got your ticket....You wouldn't have your ticket...think about that.... :) Is this like biting the hand that feeds you?

1352. FS: Brand new RS-Pro-2026 scanner

Newsgroup: rec.radio.scanner
Date: 1996-01-16 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4deu9l$1ru@cville-srv.wam.umd.edu>
Source record: 242421
Cross-posted to: rec.radio.swap,dc.forsale.misc,rec.radio.scanner

My story:

On January 1, 1996, I was looking at scanners at Radio Shack.

In fumbling around, I happened across a Pro-2026 with a date code of 4A2 (April, 1992). I have considered whether or not I really needed this scanner, and I figured I'd gotten it on sale for $147 including tax, which for a brand-new scanner that should be cell-capable was a pretty good deal.

I've since found something else, and the sale is over - it's back up to $249 plus tax. The 30-day return policy is still good, so I can return the unit until January 31 to get my $147 back with no hassle.

If you wanted to get this scanner now, it'd be $249 plus shipping.

I figured that since I got this one, and it SHOULD be cell-mod-able (although I haven't cut L201, the jumper that should enable the cell frequencies), I'd make it available to the world for about what I paid for it instead of giving it back to RS and letting them sel lit for $110 more.

Want it? If you can get payment to me prior to the 31st, I'll consider it. Remember, I haven't cut the wire yet and, supposedly, once cut the warranty is void (or so I've been told), so I'm pretty reluctant to cut it.

Make it worth a few bucks to me and I'd be even a bit more receptive :) Remember, I can always return it for a credit on my card...

Thanks!

Hi,
I'm interested in buying an AR8000 for use in the US.
Where can I get the best price for the unit?
I want to buy an unblocked unit (of course); I assume that the units sold in the US are blocked. I guess that my best bet would be to have one sent from Canada. Does anyone know of reliable sources there with reasonable prices where I could order by phone?

Thanks,

Pat

If the DSQ circuit affects audio, something else is wrong because it
should have no effect on audio whatsoever.

I designed, published and tech supported that circuit for several
years. It definitely works, so give details and maybe I can assist
somehow.

>
>Steve

Sounds great. I'll check into it again and see If I can come up with
the same results you have.

I noticed that 3 states were possible.
One - Will not work at all
Two - Will decode to much and clip on audio.
Three - Will not decode enough to continue scanning

I could not find a acceptable medium. But hearing from you
suggests that it in fact can be set up to work correctly.

By the way what scanner where you using it in? I was using
a pro 2006.

Also I used mil spec caps and 1% resistors. I found in the past
that using a scanner mobile such as I do, tempeture differences
affected components values and thus circuit performance.

Thanks for the reply.

1362. Lack of sensitivity on an ICOM R7000

Newsgroup: rec.radio.scanner
Date: 1996-01-16 00:00:00 UTC
From: rbossard@nauticom.net
Message-ID: <4deunc$c64_003@news.nauticom.net>
Source record: 242431

I would greatly appreciate some advice. My ICOM R7000 seems to have rather poor sensitivity. My handheld can pick up 800MHz signals better through its rubber-ducky. Is this a common problem with the R7000. Have they had a history of coming from the factory poorly calibrated, or is it more likely that my front-end is blown?

Thx

Rick

1363. AR8000 + Scout 40 + SAC8000 cable

Newsgroup: rec.radio.scanner
Date: 1996-01-16 00:00:00 UTC
From: g.l.g.1@ix.netcom.com
Message-ID: <4dgb0r$h3e@ixnews3.ix.netcom.com>
Source record: 242432

Hello All: A few questions I will throw out to the group.
1. Using the above equipment in car can I split the signal into both the ar8000 and the Scout 40 using only *one mag. mount ant.*? If so does one use a cable TV type splitter?

2. Is the Opto SAC 8000 interface cable able to be used with the AR8000 and the Scout 40 on a belt? Is the SAC 8000 cable; *a cable* or just wires?

3. What is the *best overall ant.* to use on the Scout. I know that the ant. length is based on the freq. you wish to receive.

4. What is the newest ver. of the Scout 40: ver. 3.1 ?

Thanks to all for your ideas and tips. Greg BTU.

I've had similar success with a product from Recoton (I believe it is the WW200 model?). It's advantage is that the seperate receiver accepts anything with a 1/8 mini plug. I use it with headphones, earplugs and powered speakers.

The advantage is that I have a choice of listening options anywhere in the house or garage. Works great through the audio input on my mini receiver in the garage too.

<< I'd really like to see a scanner that was designed to REJECT images. The
BC9000 is a really good scanner, but it could have been GREAT if the
image rejection were better.>>

I agree completely! My Radio Shack PRO-2035 gets strong cellular images in the 1105 to 1115 Mhz area and also an occassional image in the the aircraft band between 130 and 136 Mhz. This is not good since my primary interest is in the aircraft bands. I read somewhere that the BC9000 gets cellular images in the upper end of the military aircraft band (255 to 400 Mhz.) Which is exactly why I did not get one!

And also, Benito Horta (benny@shadow.net) replies:
<<how bad are the images? and what bands do [they] affect? I was thinking of a
bc9000 but like you said, I could care less about cellular. I want a good image free reciever.>>

Good question! I would like to know as well.

>appreciated.

The NFM Discriminator output (baseband audio) is available at any of
three places in the PRO-43:

1. IC-301, Pin 9
2. TP-301
3. "High" end lug of the SQUELCH control (ungrounded end lug)

The quality of the baseband audio conceivably could be slightly
degraded by the presence of C-320 (0.001-uF). It can be removed for
experimenting. Another primary influence on the quality of the
baseband audio is CF-301, typically 15-KHz wide. For high speed data
translated from FSK in the baseband audio, replacement of CF-301 with
a 20 KHz filter proves effective sometimes.

There you have it.

Rgds,

Bill

>Could someone PLEASE help me in locating the discriminator
>output on a PRO-37 scanner?

Sure. Any of three places:

1. IC-101, Pin 9
2. TP-103
3. High (ungrounded) end lug of the SQUELCH control.

C-169 can be removed if the quality of the baseband audio is just
under par. CF-101, the 15 KHz IF filter, can be replaced with a 20
KHz wide version for high speed FSK data in the baseband audio.
That would be a last resort, though.

Everyone here is so perfect, everyone says that they don't listen to the
cell phones, cordless phones, bla bla bla.

Just like I don't have a cable descrambler. I don't make copies of CD's. I
don't tape shows from TV. I also have modified my scanner to block out
everything exept the Ham bands.

I get moderate images in the VHF-hi band, and severe images of 800 MHz transmissions (including "forbidden" transmissions from the blocked band) in the 300 MHz military air band. It makes it really hard to search the mil-air band. I have heard a rumor that the front end of the BC9000 was purposely left wide to cause these cellphone images to be recieved. I hope this is not true. I'd hate to think that this otherwise perfect scanner was intentionally ruined just to allow people to be able to listen to cellphones.

Enough already! Will you two just grow up!

I don't give a flying @#%$ what your problems are with each other or with
the world for that matter.

I can't speak for everyone, but I am growing tired of you wasting the
bandwidth that others respect (not me mind you, but "others").

Take a hint from comments like: "The buffer on my server only lists back to a
few weeks... too many Cheek/Moss messages I guess !", and "maybe from having to
read too much Cheek/Moss diatribe." some of us are growing tired of your
childish banter.

When I try to read a follow up article on the Pro-26 I get verbal diaharea
(sp?) mixed in as is in the following example:

> >I need the cellular mods for The Radio Shack Pro-26 Hand Scanner if any are
> > available. Thanks.. Steve
>
Don't we all. The PRO-26 cannot be modified for cellular
reception, nor can any other scanner manufactured or imported
after April, 1994. There are a couple of roundabout exceptions,
but those require reprogramming the EEPROM. The PRO-26 is
not one of those.

Alas. 'Sniff.

>I guess we'll both have to wait and see if any users who
>know the facts will post them.

We have members of our club who have both. In the interest of
"full disclosure", *I* have an CE-232, but it doesn't work very
well... 'cause I haven't had the time to assemble it yet :-).

The reason I like the 232 better than the OPTO is that the
OPTO doesn't load the freq info into the 2006 memory. Therefore,
the minute you turn the computer off, or disconnect the computer,
you lose everything you programmed (at least until you reconnect
the computer).

I want the interface to program freqs in my 2006, then I'll unplug
it and program freqs in my 2004 which I may take with me on a trip
(without my computer). I possibly may be able to use it to program
my PRO-43, but I haven't decided if I'm "good" enough with the
micro circuitry to attempt that (and with hacking the case in a way
that won't compromise it's portable use). The people in our club
with 232 have only used them with the 2004/5/6 series, so I
have no "pioneering guide" to discuss the PRO-43 mod with :-).

The OPTO does a great job, and it's ready built. The people in
our club who have it seem very happy with it also. As along as
the computer remains connected to the scanner, it does a great job.
I think the OPTO can interface with a wider variety of computer
software than the 232, but I'm not sure.

Sorry that this is not an "exhaustive review", but perhaps it
will yield you some useful info.

I have a BC2500XLT in Excelent condition. It has never been used outside the house. All known MODs have been applied.

All original packing materials and box are present along with accessories:
Antenna, Charger, Leather Carrying case, Belt Clip, Operating guide and Registration form.

The features include:
100 channel/second Turbo Scan
VFO Control
Direct Keypad entry
400 channels
20 banks
25MHz - 1.3GHz
10 Priority channels
Auto Scan for Weather channels
Auto Store while scanning
Auto Sort
Retains programming with battery removed.

Asking $300.00 I'll pay shipping.

1391. Uniden Bearcat SC 150Y

Newsgroup: rec.radio.scanner
Date: 1996-01-17 00:00:00 UTC
From: tazoid@brutus.bright.net
Message-ID: <4dhevu$grt@brutus.bright.net>
Source record: 242236

I am looking for the cellular freq mod for the Uniden Bearcat SC 150Y.
email me at tazoid@brutus.bright.net or just post it here. Sorry if this is a
frequent question, I couldn't find a FAQ.

1392. Re: Need San Jose Area Freque

Do you have freq. for Napa County, CA by any chance? Like for SO, PD,
and Ambulances and pagers (voice one)????

Please e-mail me.

I'm willing to bet that most thieves don't have the motivation to even be
as prepared at that (owning & properly using a scanner). I think too, that
they are more scared of a confrontation than that (don't even want a
"close call"). They don't have hobbies (scannning or other technical
stuff,
don't use a PC), they have HABITS.

1398. Mathematical Image Freq Calculation

Newsgroup: rec.radio.scanner
Date: 1996-01-17 00:00:00 UTC
From: hq124@cleveland.Freenet.Edu
Message-ID: <4diutq$9gm@madeline.INS.CWRU.Edu>
Source record: 242243

I read in a book on scanning that the freq at which an image occurs can be calculated by doubling the IF freq and adding it to the freq of the target. In testing this, I am coming up with fairly substantial variations, leading me to believe there might be additional variables that need to be considered in the formula. Might this be because my scanner is triple conversion? At first, I thought the factory speced IF might have been misprinted, but now it is looking more like I need a more complex calculation.

Can anyone help me by shedding some light on this mystery?

--- Judy May hq124@cleveland.freenet.edu

Then you want....

AOR AR5000 - "The new Horizon"

New wide band, all mode base receiver 10KHz - 2600MHz

<Picture>

AOR have been synonymous with pioneering design of high quality wide
band receivers for many years building on the strength of the AR2001,
AR2002, AR3000 and AR3000A. The tradition continues and we are proud
to announce the arrival the very latest receiver...the AR5000.

The new receiver is not based upon any specific earlier model but
draws on the best points and combines this experience with the latest
circuit design. The result of this clever RF design is a very
sensitive receiver with excellent strong signal handling capabilities
over a very wide receive range.

The AR5000 is housed in a newly designed solid metal cabinet and
provides a very wide receive frequency coverage from 10kHz to 2600MHz,
all mode reception FM, AM, USB, LSB & CW and MANY microprocessor
facilities aimed toward professional monitoring and the dedicated
listener.

Receive circuit details

The AR5000 features a NCO (Numeric Controlled Oscillator) providing
tuning rates right down to 1Hz. A TCXO is fitted as standard and used
in conjunction with the WWV signal reference to ensure a very high
degree of stability.

The receive circuitry is based around a triple superheterodyne with
I.F.s' of 622MHz, 10.7MHz &455kHz. Multiple switchable I.F. bandwidths
are available in both the 10.7MHz and 455kHz I.F. stages: 3kHz, 6kHz,
15kHz, 40kHz, 110kHz & 220kHz with provision for a 500Hz option.

This great advancement in wide band front end design has been made partly due to the introduction of automatic electronic preselection between 500kHz - 999.999999MHz with low pass, band pass and high pass filters covering other bands. This is a real achievement for a receiver ith such a wide frequency coverage and scan/search speeds of up to 50 channels per second.

The AR5000 offers excellent receive sensitivity across the range, typical figures:

10 - 20 MHz 0 56uV AM 6kHz filter 10dB S/N
0 25uV SSB 3kHz filter 10dB S/N
0.36uV FM 6kHz filter 12dB SINAD
0.40uV FM 15kHz filter 12dB SINAD90 - 150 MHz 0.50uV AM 6kHz filter 10dB S/N
0.20uV SSB 3kHz filter 10dB S/N
0.25uV FM 6kHz filter 12dB SINAD
0.28uV FM 15kHz filter 12dB SINAD400 - 700 MHz 0.56uV AM 6kHz filter 10dB S/N
0.23uV SSB 3kHz filter 10dB S/N
0.28uV FM 6kHz filter 12dB SINAD
0.32uV FM 15kHz filter 12dB SINAD

Aerial input is via high quality N-Type connector and secondary switchable SO239 connector. A switchable preamplifier is employed for the short wave bands.

Microprocessor control

To compliment such receive excellence, the microprocessor facilities are right up to date and full featured. There are a total of 1000 memory channels provided in 10 banks of 100 channels with a large EEPROM memory store. 10 search banks are provided with a total of 1100 PASS frequencies. Scanning and search speed is a very respectable maximum of 50 channels or increments per second. Auto-memory may be switched On/Off and a special Frequency Offset facility has been provided to simplify DUPLEX frequency monitoring.

A large rear illuminated segmented liquid crystal display provides a wide range of operating detail including frequency, mode, AGC, etc but also displays up to 7 alpha-numeric text characters so that comments may be entered to accompany memory channels & search banks to aid easy identification and retrieval of data.

An analogue S-meter provides easy to see relative signal strengths.

A wide variety of search and scan types are available including memory scan, select scan (your temporary favourite frequency notepad!), mode scan, bank scan, search bank link etc. The squelch too may be configured for noise, signal level, audio level, CTCSS.

A DTMF decoder is provided to display DTMF characters in use and CTCSS search to display the CTCSS frequency in use. Audio low pass and high pass filters may be configured and are switchable around the following frequencies: LPF 3kHz, 4kHz, 6kHz &12kHz, HPF 0.05kHz, 0.2kHz, 0 3kHz &0.4kHz. De-emphasis is also selectable: THRU, 25uS, 50uS, 75uS & 750uS.

A detailed microprocessor based auto mode bandplan has been programmed for the specific market area so that selection of receive mode, step size and I.F. bandwidth may be carried out automatically by the AR5000 making frequency change quick and searching meaningful. Of course the auto mode may be manually over-ridden at any time. Step adjust helps follow non-standard & unusual offsets on bands. The aerial selection may also been programmed for automatic fast change.

There are a total of FIVE VFOs provided so keeping track of a number of "hot" frequencies is very easy. There are two tuning knobs provided; the main knob provides tuning steps from 1Hz to 999.999kHz and has mechanical variable torque adjustment. The second knob provides step selection of 100Hz, 1 kHz, 10kHz, 100kHz, 1 MHz and x10 for rapid tuning.

Other useful facilities include a built-in clock On/Off timer alarm and variable beep tone.

Extensive remote control

Extensive facilities are available via the RS232 port which is standard on the AR5000. Even the volume and squelch controls may be remotely controlled.

Output terminals are provided for external speaker and detector for improved decoder compatibility. Provision has been included for an optional built-in signalling unit.

SDU5000 ready

The AR5000 is ready to plug straight into the optional SDU5000 spectrum display unit for "real time'' band occupancy evaluation and measurements in both frequency and dBm signal level. The 10.7MHz I.F. output of the AR5000 has a suitable 10MHz bandwidth ideally matched to the SDU5000. (Note: a microprocessor upgrade may be necessary in the SDU5000

Key features

•Very wide frequency coverage 10kHz - 2600MHz •All mode reception: AM, FM, USB, LSB &CW •Automatic electronic preselection of the front end •Excellent strong signal handling •NCO (Numeric Controlled Oscillator)

with tuning steps down to 1Hz ⊕TCXO fitted as standard ⊕Multiple I.F bandwidths 3kHz, 6kHz, 15kHz, 40kHz, 110kHz &220kHz ⊕Auto mode bandplan selection ⊕Multi-function LCD with 7 character alpha-text comments ⊕Extensive search & scan facilities ⊕Fast search & scan speeds up to 50 channels / increments per second ⊕Analogue S-meter ⊕1000 memory channels and 10 search banks with EEPROM storage ⊕Auto memory store ⊕Extensive RS232 command list ⊕Sleep timer / alarm ⊕SDU ready

Availability &Price

We hope to have a first delivery of the AR5000 during the first week of January. The suggested U.K. retail price has been set at ⊕1749.00

inc. VAT & Carriage. For any Customers outside the EC (European Community) the price will be around ?1450.00 including delivery. As a guidline this works out to be around US$2200 at current exchange rates (?1 = $1.53 on 2nd Jan). Local Import Duties maybe payable.

E-Mail Javiation for further information

For less money you can some of these features in a handheld radio called the AR8000.

And let's not forget that there is nothing preventing Uniden or Radio Shack or anyone else from licensing the digital format and producing a digital scanner. Trunking protocols are proprietary, and as such, the scanner companies would have a hard time getting ahold of them. Project 25 digital protocols can be licensed by anyone (at least to the bst of my knowledge). The only thing stopping the companies from making a digital scanner would be the refusal of Motorola and other Project 25 designers to licence the protocol for recieve-only. In that case, I guess all of the "digital is just an anti-scanner scheme" posts would be true. I'll reserve judgement, though, until the manufacturers have had a reasonable amount of time to design a digital scanner.

The radio spectrum DOES need to be used more efficiently. Digital modulation is much more efficient than analog FM. As long as the companies involved in creating Project 25 have not decided to use/sell it as an anti-scanner scheme, then the only thing we scanner listeners have to worry about is the (probably) hefty price tag on that first digital scanner.

>Phil

The transformer is connected to AC power all the time it is plugged in. My
hummed terribly too.

Just get yourself a 12V - 14V DC, 500mA (or higher) power supply (the kind
that plugs into the wall directly....a "wall wart" or "calculator power
supply" as some people know them) with the appropriate connector AND wired in
the proper polarity (center pin positive).

Use this external DC supply to power the scanner rather than the AC line cord,
and you will enjoy a quieter, cooler scanner. Just make sure your DC supplies
transformer doesn't ALSO hum!

It's still a damn good phone though. I just bought one. I have to admit doesn't look like the technology has changed much over the years; and even though it has crappy scrambling.. if you don't care about that it has fantastic range and is VERY clear. Mine has the full phone on the base as well which is very handy and a great speaker phone.

I have heard the new spread spectrum phones has even longer range and are "cd-quality" but the quality cant really be much better than on this motorola phone I just bought. Plus all the spread spectrum phone cost as much or more as this one and have no phone on the base or volume controlls.. or any of the extras like the motorola.

Plus it's cool cause its like a little flip phone. (just though I'd toss that in... :-))

No, I don't work for Motorola or anything...

Just happy with my purchase...

You bet. They all have to get licenses, and the FCC makes these license public knowledge.
PerCon and grove both sell reasonably priced CDs with most of the FCC database on them.

Well, there were several people asking about what frequency x to xx is
used for, so I am posting this. Hope it helps.

I am also including the 10 and 11 codes.

-MIkEy

Complete Frequency List of The Entire Spectrum

1 10-150 kHz Military/Government, submarine communications
2 150-535 kHz Longwave Band. Beacons, foreign broadcast, maritime
3 535-1700 kHz AM Broadcast Band
4 1.7-30 MHz Shortwave/High Frequency Band. Broadcasting, two-way
government, military and commercial communications, amateur
radio, others.
5 30-50 MHz Very High Frequency Band. Government, business, walkie-
talkie, and cordless phones
6 50-54 MHz Amateur Radio 6-Meter Band
7 54-72 MHz TV Channels 2-4
8 72-76 MHz Manufacturing, remote control, eavesdropping bugs, etc.
9 76-88 MHz TV Channels 5-6
10 88-108 MHz FM Broadcast Band
11 108-136 MHz Aeronautical communications
12 136-138 MHz Satellites
13 138-144 MHz Military communications
14 144-148 MHz Amateur Radio 2-Meter Band
15 148-150.8 MHz Military Use
16 150.8-174 MHz Business, highway, law enforcement, government weather,
maritime
17 174-216 MHz TV Channels 7-13
18 216-220 MHz Maritime and aeronautical
19 220-222 MHz Land mobile communications
20 222-225 MHz Amateur radio
21 225-400 MHz Military aviation and space
22 400-406 MHz Military and government
23 406-420 MHz U.S. Government
24 420-450 MHz Amateur radio
25 450 470 MHz Ultra High Frequency Band. Business, industry, military,
fire, government
26 470-512 MHz TV Channels 14-20, shared with law enforcement
27 512-825 MHz TV Channels 21-69
28 825-849 MHz Cellular telephones
29 849-851 MHz Aeronautical telephones
30 851-866 MHz Business, public safety

31 866-869 MHz Public safety, law enforcement
32 869-894 MHz Cellular telephone systems
33 894-896 MHz Aeronautical telephones
34 896-901 MHz Private land mobile units
35 901-902 MHz Mobile radio
36 902-928 MHz Land mobile, amateur radio, personal communications units
37 928-932 MHz Radio paging
38 932-935 MHz Government/Private microwave
39 935-940 MHz Business radio
40 940-941 MHz Mobile radio
41 941-944 MHz Government and non-government fixed services
42 944-952 MHz Broadcaster's studio-to-transmitter links
43 952-960 MHz Private fixed services, paging
44 960-1240 MHz Aeronautical navigation
45 1240-1300 MHz Amateur radio
46 1300-1350 MHz Aeronautical navigation
47 1350-1400 MHz Radio location
48 1400-1427 MHz Radio astronomy
49 1427-1429 MHz Point-to-point, mobile, space
50 1429-1660.5 Various satellite transmission uses
51 1660.5-1668.4 Radio astronomy
52 1668.4-1700 Meteorological aids
53 1700-1850 MHz Meteorological satellites, U.S. government
54 1850-1990 MHz Fixed point-to-point, microwave
55 1990-2110 MHz Broadcast studio-to-transmitter links

The Shortwave Bands Up Close

Frequency Range (MHz) Meter Band
2.3-2.495 120
3.2-3.4 90
3.9-4.0 75
4.75-5.06 60
5.9-6.2 49
7.1-7.35 41
9.4-9.9 31
11.6-12.1 25
13.57-13.87 22
15.1-15.8 19
17.48-17.9 16
18.9-19.02 15
21.45-21.75 13
25.6-26.1 11

Amateur Radio Bands

Frequency Range (MHz) Meter Band
1.8-2.0 160
3.5-4.0 80
7.0-7.3 40
10.1-10.15 30

14.0-14.35 20
18.068-18.168 17
21.0-21.450 15
24.890-24.990 12
28.0-29.7 10

Note: Frequencies outside of the bands assigned to the broadcasting and amateur radio (and sometimes within them) are used by a wide variety of stations: fixed communications stations, maritime and aeronautical, U.S. and foreign military communications, U.S. and foreign government, standard time, so-called "spy" broadcasts, VOLMET aviation weather reports, shortwave broadcast feeder stations, unlicensed "pirate" broadcasters and more. Transmissions may be in voice (AM or single-side-band), Morse code, various forms of radioteletype, facsimile, or more esoteric forms of modulation.

A Quick Guide to Common Terms

AM-Amplitude modulation. A radio frequency (RF) carrier signal combined with an information signal.
FM-Frequency Modulation.
Frequency-Number of "waves" a transmitted signal produces in one second.
kHz-Kilohertz (1000 Hz).
Meter band-Expressed in meters, the wavelength or physical length of a transmitted signal's wave.
MHz-Megahertz (1,000,000 Hz or 1000kHz).
Radioteletype-RTTY. Signals sent to and from teleprinter machines.
Skywave-Radio waves that use the ionosphere's refraction capabilities.
Sunspot cycle-A scientifically determined cycle of sunspot occurences on the sun's surface that affect shortwave radio communications. A typical sunspot cycle is about 11 years, although scientists frequently argue the cycle is actually 22 years.

Police Radio Codes

10-1 You are being recieved poorly 11-6 Illegal discharge of firearms
10-2 You are being recieved well 11-7 Prowler
10-3 Stop Transmission/Change channels 11-8 Person down
10-4 Message recieved 11-10 Take a report
10-5 Relay message 11-12 Dead animal/Loose livestock
10-6 Station is busy 11-13 Injured animal
10-7 Out of service/Off the air 11-14 Animal bite
10-8 In service/On the air 11-15 Ball game in street
10-9 Repeat last message 11-17 Wires down
10-10 Out of service, radio on 11-24 Abandoned vehicle
10-11 Give FCC call sign/Talk slower 11-25 Traffic Hazard
10-12 Visitors present 11-25x Female motorist need assistance
10-13 Advise weather/road conditions 11-27 No records or wants/
10-14 Convoy or escort detail drivers license check
10-15 Enroute to jail with prisoner 11-28 Rush vehicle registration info
10-16 Pick up prisoner 11-29 No record or wants
10-17 Pick up documents 11-30 Incomplete phone call

10-18 Complete assignment quickly 11-31 Person calling for help
10-19 Go(ing) to station 11-40 Is ambulance needed?
10-20 (what is your/my) location is 11-41 Request ambulance
10-21 Telephone the station 11-42 Ambulance not needed/
10-21h Telephone home Request paramedics
10-22 Cancel last message 11-43 Doctor required
10-23 Stand by 11-44 Fatality
10-24 Trouble at station 11-45 Suicide
10-27 Check for warrants 11-46 Death report
10-28 Check vehicle or subject 11-47 Injured person
10-29 Check vehicle or subject wants 11-48 Provide transportation
10-30 Subject has no record or wants 11-50 Field interrogation
10-31 Subject has record, no wants 11-51 Security check
10-32 Subject wanted 11-70 Fire alarm
10-33 Emergency traffic on air 11-71 Fire report
10-34 Clear for emergency traffic/ 11-78 Paramedics dispatched
Resume normal broadcasts 11-79 Accident - ambulance sent
10-35 Confidential Information/ 11-80 Accident - serious injury
Backup needed 11-81 Accident - minor injury
10-36 Correct time (is) / 11-82 Accident - no injury
Confidential information 11-83 Accident - no details
10-37 Correct time (is) 11-84 Direct traffic
10-39 Message delivered 11-85 Request tow truck
10-86 Traffic check 11-86 Special detail/Bomb threat
10-87 Meet the officer 11-87 Assist officer/Bomb found
10-97 Arriving at assignment 11-88 Assist the motorist
10-98 Assignment completed 11-98 Meet the officer
10-99 Officer needs help, EMERGENCY 11-99 Officer needs help, EMERGENCY

It sounds like you want to actually transmit. On the PRO-39 this is not
possible.
The vast majority of transmissions require a license from the FCC (at
least, here in the U.S. If you are in Canada, or another country, you
will have to find out where to get your license from).
Getting a HAM license is not difficult here, with the new no-code
license.
Go for it!
Bill Funk

have an icon r7000 scanner.

does any know of a way for get the frquencys from 1000-1025mhz.

would be nice to have these frequencies covered.

already have a converter form the freq 1 to 45mhz for these unit.

The database IS NOT very accurate. Actually it is out of date. Check
the call KMA628 - Los Angeles County Sheriff's Department. The listing
showed 40-50 megs or somthing like that. They have been at 480 Mhz for
the last 5 years AT LEAST! And they are still registered under that call.

I was at the Percon Corp. web page earlier. Check the call KMA628 - Los Angeles County Sheriff's Department. You DBase is outdated. They have been up in the 480Mhz range for at least the last 5 years. You still show them on the 40-50Mhz spread.

WRONG BAND!!!!!

The subject line says it all. Please sent any BC700A tips,
tricks, or mods to legeros@nando.net

If I get a substantial response, I'll archive same on my
home page.

Thanks!

mjl

==========

I doubt very much thatEricsson will license Uniden (or anyone else) to
use their proprietary trunking system in a *scanner*, regardless of what
other radios they allow to use it.
In other words, the fact that Ericsson and Uniden have reached an
agreement to allow Uniden to use Erricsson's trunking system in certain
radios, does not mean that that agreement automatically covers scanners,
too.
Reps are notorious for not knowing what's going on upstairs, and have a
reputation for saying what the rep thinks the listener wants to hear.

You assume that such a mod exists... I've seen LOTS of requests for
information about such a mod. I have seen NO replies that even hinted
that such a mod exists.

==========
I don't know if you are a police officer or not (your post gives no clue).
The scenario you describe doesn't occur ver often at all, for several reasons.
Most burglars want nothing more than to get in and out with no hassle. A scanner would only help the burglar get away; he'd have no reason to stay to set up a confrontation.
Very few (and I mean *very few*) criminals use scanners. So few that when it does occur, it's very remarkable, and the story really makes the rounds. Of course, what's forgotten in the retelling is that the scanner obviously didn't help much (he got caught, didn't he?).

Mint conditioned, already-modded BC200XLT are selling routinely for $150
to $175. I haven't seen a Danmark catalog in about a year, but the last
one I saw had refurbished BC200XLTs for $175. I heard too that Walmart was
selling them but I haven't bothering checking.

1423. Re: Computer Interface for pro 2006

Newsgroup: rec.radio.scanner
Date: 1996-01-17 00:00:00 UTC
From: pro43@aol.com
Message-ID: <4diqh3$4a8@newsbf02.news.aol.com>
Source record: 242268

Unfortunately,I only have one of the 2 interfaces mentioned.I have the CE-232.It seema the big difference is the OptoScan board replaces the 2006 CPU with its own.This allows freq searches and scans in otherwise unavailable areas.
The CE-232 acts as an addition to the scanner.The CE allows auto programing.You can keep files of freqs(especially if you travel)in your computer.Then if you get tired of the set youre scanning, or heading to another city,you can bring up the files for that area press a couple buttons and sit back while the computer programs the radio.(opto does not do this).
Recently the CE was on sale for 149$ and the opto is 299$.

1424. Wisconsin freqs- and some 800 MHz questions

I find the 800 mHz freqs travel a lot farther than 15x.xxx or 46x.xxx
freqs. I am also picking up West Allis on the Greenfield freqs:

856.4625 857.4625 859.4625 860.4625

Please check this interesting FREE RESOURCE found on the WEB
PerCon Frequency Database Callsign & City Search

This is a sample database extraction from SPECTRUM / Winter 95 , with
over
3.3 million records. These searches and several more can be yours for
only
$29.95 plus $7.50 S&H (2 Day Delivery). Our Regional Series / Fall 95
are
available for $129.95 plus $7.50 S&H (2 Day Delivery). This is a Beta
Search System, so let us know if you experience any problems.

This search system may be found on the WWW at
http://www.perconcorp.com/db_srch.htm

You can use this to locate frequencies to plug into the AR8000.
Using TEXTPAD for W95/NT you can edit a saved text file to squirt into
the
AR8000 by just copying it to the serial port.

To use paste this URL into MS INTERNET EXPLORER.
Enter required data to search for.
Read results when server returns.

Select a line that describes what you found like this by highlighting
the
text and pressing ctrl-C
POLK, COUNTY OF PP CEDARTOWN

Enter ctr-S to get save as window.
Make sure Save as type is = Plain Text (*.txt)
is selected

Enter ctrl v then press ENTER
A file with the name POLK, COUNTY OF PP CEDARTOWN.txt will
be
saved to your desktop.

Even better is to create a new folder to keep all your results
together in
by pressing the second yellow icon to the right of the window labled
Save
in
A new folder will appear in the big window called New Folder
Since it is highlighted type in a new name such as AR8000 Frequencies
to
Scan and press ENTER to save it and select it.

If it isn't selected click twice on it to make it selected!
Your found frequencies will auutomatically be collected and stored in
that
folder.

Then your session can become a quick find, read results annd highlight
a
suitable piece of text for a long file name followed by these keys as
fast
as you can hit them
CTRL C CTRL S CTRL V ENTER
and your done.

More about making this a quick squirt file in another message.
'SQUIRT' = shoot that sucker to the serial port for automatic
reprograming
of the AR8000 high tech scanner.

Why do you have to HEAR what is going on to tell what you are getting for your tax dollars?

Take a ride with a cop some night, when you get a call on a breaking & entering. You get in the area and the suspects are already out the door. You turn off you siren and arrive at the location only to find that the suspects are long gone, along with valuables, leaving behind only damage. A witness states that they though the police were already there as they heard the police radio inside the location 10 min ago.

Now, what if there were still there, listening to you talk to your dispatcher, as you told them your exact point of entry, where the other units are located, where the perimiter is being set up, so that they are ready to do harm to you, and excape un-noticed because they know where all the cops are!

Take a ride if you want to know where your tax dollars are at when it comes to your local police, and see it from their side....

Dave

I also recommend you check out "http://www.perconcorp.com". The Percon
Spectrum or Spectrum-Lite CD-Roms have FCC license information useful in
tracking down frequencies. One big problem is that a lot of companies
"hide" behind corporate or even individuals names and big corporations
even start seperate corporations for radio licensing. A Optoelectronics
Scout is VERY useful is you have $$$ but a standard frequency counter
can be useful if you can get close. One of the best cheap ways to find
frequencies is to find a nice copy of standard frequency allocations and
to get very familar with where things are located. For books, Beyond
Police Call is a little useful. Monitor America is pretty good. I
collect frequencies for *everything*. A lot of them are usually very
dull but it's nice to be able to pop them into a bank if something major
(special event, building fire, ???) goes down.

Best Regards,
Billy R. Jones

How about a 100% computer controlled scanner. The memories would be limited only by the amount of hard disk space one may have. A 16550 UART would be used to communicate at high speed to the receiver it's self. Software would be GNU and written in C so that it can be used on multiple platforms such as Unix, OS/2, and microsoft products.

The receiver it's self would cover from 30 MHz to 1300 MHz without holes. CTCSS, DTMF, and a trunking type scheme would be incorpirated. For example, when monitoring a trunked system, the data channal can be monitored and units followed accross the trunk automaticly. Since it's computer controlled all trunking protocols would be supported automaticly. All pager protocols will be supported with decoders. A variable filter would be incorpartated so that you can notch out intermod, a preamp can be built into this ckt as well. All modes would be supported from AM to Spread Spectrum. Activity logging is something that can be used. A VOX or COR tape deck should be built into this box as well. A interface to a sound card could do the job here as well. 16 Mb of buffer RAM so that preconfigured setups can be uploaded to the scanner.

The scanner should be flexable enough that only the limits of your imagination would stop you. All in the size of a average telephone.
I would be willing to pay $2500 - $3000 for this product. Provided that this scanner is built like a brick sh*ter. RF only enters though the antenna port.

If Uniden only knew how easy this would all be to do. Everything I am asking for is availiable but not in one package. To get rid of that 19" rack mounted equipment would be great!

Ahh....What a dream

NEWSRADIO <jmckay@interlog.com> wrote:

>..I bought one of those "baby monitors" from radio shack
>and modified the base unit by installing a jack
>that cuts out the internal mic....

Posted this a few years back:

CONVERTING THE FISHER-PRICE BABY MONITOR INTO A REPEATER

Bob Parnass, AJ9S

The Fisher-Price baby monitor (model 157) consists of an AC operated, low power FM transmitter, and a battery operated receiver. Both transmitter and receiver are equipped with 2 crystal controlled channels in the 49 MHz range. The unit modified for this article was equipped with 49.845 and 49.875 MHz channels, designated 'C' and 'D' respectively.

This modification allows a hobbyist to connect the baby monitor transmitter to the TAPE jack of a scanner or shortwave receiver and rebroadcast the transmissions in the 49 MHz range. One can roam around the house or yard with the portable baby monitor receiver, a portable scanner tuned in the 49 MHz range, or even a 2 meter walkie talkie tuned to the 3rd harmonic, listening to transmissions intercepted by a base receiver.

No changes are needed in the baby monitor receiver, although one could disconnect the red light emitting diode (LED) to prolong battery life. In the transmitter, we will be disconnecting the microphone and installing a 1/8" phone jack and DC blocking capacitor.

Parts needed for the modification:

- 1/8" miniature phone jack

- A capacitor with rating of 25 volts or higher. Use of the baby monitor with most receivers requires a 0.001 microfarad capacitor, e.g., a Radio Shack PRO-2004, PRO-2005, PRO-2006, Icom R-7000, R71A, or NRD-525 receiver. Older Bearcat

scanners, like the Electra Bearcat BC300, BC220, BC20/20, or BC250 scanner will require you use a 0.1 microfarad capacitor instead.

- insulated hookup wire

- solder

- heat shrink tubing or electrical tape

To modify the Fisher-Price transmitter:

1. Make sure the transmitter is disconnected from the AC line.

2. Turn the transmitter upside down and use your fingernail or a small screwdriver to remove the rubber feet, fastened with rubber cement. You should now see 4 Phillips screws holding the top and bottom of the plastic cabinet together. Remove the 4 screws and save them for reassembly.

3. The rubberized antenna and microphone are connected, using crimp on connectors, to pins on the printed circuit board (PCB). Using a needle nose pliers, temporarily disconnect the white wire that connects the antenna to the PCB.

4. Using a needle nose pliers, disconnect the 2 conductors of the shielded cable that connect the microphone to the PCB. Tape the ends of the shielded wire and stuff them back into the cabinet top. The microphone is disconnected to prevent the transmitter from repeating room noises. If you don't disable the microphone, you will be "bugging" your own house!

5. Remove the cabinet top and drill a 1/4" hole in the side of the cabinet top.

6. Mount a 1/8" miniature phone jack in the hole. Don't overtighten the nut or else the plastic case might crack.

Note: although most phone jacks have 3 solder terminals, we will be using only 2 of the 3 terminals.

7. Solder the end of a piece of insulated hookup wire to the sleeve terminal of the jack.

8. Solder the other end to the pin on the PCB where the microphone shield had been connected.

9. The original circuit placed a DC voltage across the microphone. We must add a blocking capacitor to prevent any DC from flowing between the transmitter and the scanner or shortwave receiver. Solder one end of the capacitor to the tip terminal of the jack.

10. Solder the other end of the capacitor to a short length of insulated hookup wire.

11. Slip a length of heat shrink tubing over the capacitor. If you have no tubing, you can use electrical tape instead. Solder the other end of the wire to the pin on the PCB where the micro-phone center conductor had been connected.

12. Reconnect antenna to the PCB.

13. Using the 4 Phillips screws from an earlier step, reassemble the cabinet top and bottom pieces.

14. Replace the rubber feet. That completes the modification.

Use a shielded patch cord to connect the Fisher-Price transmitter to the TAPE jack of your scanner or shortwave receiver. If your receiver has no TAPE jack, try connecting the transmitter to the earphone jack.

As a last resort, you could use the external speaker jack. If audio from the speaker jack overloads the baby monitor transmitter, producing distortion, use an attenuating patch cable to reduce the audio signal level.

The same modification has been applied to the PlayS-chool baby monitor, which is housed in a different style plastic case.

If your neighbors have scanners, cordless phones, or baby monitors, they can probably listen in to your scanner, too!

1434. Re: What do people talk about on cellular?

Newsgroup: rec.radio.scanner
Date: 1996-01-17 00:00:00 UTC
From: VUBS79A@prodigy.com
Message-ID: <4dj6rf$25m2@usenetw1.news.prodigy.com>
Source record: 242279

>I am interested in why people go to great lengths and modify their scanner >to eavesdrop on cellular conversations. Is there anything interesting
>that people talk about?

Drug deals in progress, crooked politicians, lawyers cheating their clients, doctors cheating their patients, illicit love affairs, domestic arguments, radio and television station remote broadcasts (including the "off-the-air" conversations between the DJ on location and the board operator back at the station), police officers who use the cellular for "sensitive information" that they don't want to transmit over their conventional radios because "someone might be monitoring" <vbg>, etc.

Does any of this interest you?

Of course, this is only based on what others have told me. I would never personally listen to the cellular frequencies, of course, because the ECPA of 1986 specifically forbids me to intercept these particular, unscrambled radio transmissions that may find their way onto my property and invade the privacy of my home.

-Drew in Charlotte-

1435. PRO51 or PRO60...Help ASAP

Newsgroup: rec.radio.scanner
Date: 1996-01-17 00:00:00 UTC
From: joolson@ccgate.dp.beckman.com
Message-ID: <4dj4bj$21j@inet.dp.beckman.com>
Source record: 242280

About 3 weeks ago I bought the PRO51 ($199) and started my learning
experience. For $249, I can get the PRO60. My questions are;

What additional 'stuff' is available with the Mil A/C band?
Isn't most of it scrambled anyway?

If the PRO60 receives AM/FM/WFM, then what is the PRO51
receiving?

The 50 channel/sec scan rate works great on the 51. Can the
25 Channel/sec scan rate of the 60 be increased? This seems
a major drawback of the PRO60 to my thinking.

The Nominal Sensitivity specs for the 51 seem to be slightly better
for the 51. Does this mean it receives slightly better than the
60 when actually listening?

I don't know if there is any advantage to the 60 over the 51.
I do live 70 miles from NAS Lemoore in central Calif, but if
they are scrambled anyway, I'm not gaining much.
I only have until Sunday (1/21) to decide, so would appreciate
any info as quickly as possible. (decisions, decisions)

Thanks in Advance
J Olson

1436. Icom R7000 receiver anthology

Newsgroup: rec.radio.scanner
Date: 1996-01-17 00:00:00 UTC

ICOM IC-R7000 RECEIVER ANTHOLOGY

Compiled by Bob Parnass, AJ9S

EXAMINING THE ICOM IC-R7000 RECEIVER

Copyright 1986 by Bob Parnass, AJ9S

The long awaited ICOM R7000 is here. I bought my R7000 (S/N 001400) on June 14, 1986 from Spectronics, and agree with other R7000 owners: ICOM did their homework on this radio.

I had several questions about the R7000 that were not answered in ICOM's advertisements, and could only be answered by fiddling with the real thing:

1. Can one set the R7000 to behave like a "normal" scanner, waiting for a transmission to complete before resuming the scan? Contrary to the review in July Monitoring Times, the answer is YES. There are 4 choices of when to resume scanning (or seaching), and this is one of them.

2. Does the R7000 have a "search and store" mode, like the old Bearcat 250? Yes, and it's well done. There is a mode which will search between two frequency limits, and store the active frequencies in the top 20 channels. The R7000 is smart enough not to store duplicate frequencies.

3. Does the R7000 use the concept of a "channel bank"? Yes, one can select and deselect any of the 99 channels to be in a bank. This is much more flexible than traditional scanners. For example, the user can form a bank composed of channels 2, 5, 31, 48, and 79.

4. Does the Priority Scan feature work like a Bearcat scanner? Well, sort of. The best way to describe the ICOM R7000 priority algorithm is to say is resembles using a Bearcat scanner in the manual mode with the priority feature selected. One cannot "scan" more than one channel on the 7000 while sampling the

priority channel. On the plus side, the priority frequency does not use up any of the 99 channels, but is programmed from the keyboard and has its own register. The user can use the "scan speed" control to set how often the priority frequency is sampled, a

nice touch. In practice, the R7000 dwells on the priority frequency for a little too long, essentially chopping up the signal on the non priority frequency too much.

Using the internal, top-mounted speaker, the R7000 has good audio power and fidelity, better than my R71A.

The user manual is generally good, and a schematic is furnished. Some broken English makes it unclear as to whether the R7000 battery backed up RAM contains firmware as in the R71A.

There are provisions for activating a tape recorder when a signal is received, but there is about a 1 second delay in activation, causing the recorder to miss the start of the transmission. I may replace the capacitor in that relay circuit when I get the nerve to open the cabinet for the first time.

Another relay is used to switch in some filters for reception above 512 MHz, so one hears the relay clicking while scanning a mixture of low and high frequencies, a bit unnerving.

There's a lot of fun to be had with the R7000. It was interesting tuning through the link and paging signals in the 72-76 MHz band, and listening to military aircraft in the 200-400 MHz band.

My UHF antenna system consists of a government surplus FAA discone, good for coverage between 150-1200 MHz. Although not as good as a Butternut SC3000 antenna in the 150-174 and 440-512 MHz ranges, the discone has the edge in the 225-400 and 512-1200 MHz bands. At these frequencies, a low loss feedline is very important, and I use a Belden 9913 clone made by International Wire and Cable.

COOL YOUR ICOM R7000 RECEIVER WITH ANOTHER HEAT SINK

Copyright 1988 by Bob Parnass, AJ9S

[NOTE: This article was published in the November 1988 issue of The Radio Enthusiast and the February 1989 RCMA Newsletter.]

The new ICOM R7000 25-2000 MHz receiver is a super radio, but the power supply tends to run hot. The two biggest

- 3 -

heat generators are the pass transistor and bridge rectifier module. The stock heat sink, a flat piece of metal bolted to the inside of the cabinet rear, is inadequate. After 30 minutes of use, the back panel gets very hot, and the entire cabinet warms.

I added a small heat sink to the outside of my radio, using the screw that holds the bridge rectifer to the stock heat sink. An application of heat conductive grease between the added sink and the cabinet helps the heat transfer process. Now the rest of the cabinet gets barely warm to the touch.

ADD A COOLING FAN TO YOUR ICOM R-7000 RECEIVER

by Brian Kantor, WB6CYT1

In my R-7000, adding a fan makes a big difference. I've had it on continuously for three days now, and it's still nice and cool. Turns out most of the heat comes from the transformer core in the AC supply. One of those 3-1/2" 12V DC fans fits just nicely - a pair of 1/4" standoffs screwed through two of the upper back panel ventilation slots holds it in place, the power leads snake through the lower ventilation slots, and some duct tape to form a gasket, and it pulls the hot air right out. If you pick the 12V off the power supply regulator board at W3 (orange lead), it will even work properly when you run the radio off 12 volts.

[In order to blow hot air out, the fan must suck in cool air from somewhere. Users are advised to be on guard for dust being drawn into fan-equipped R-7000s. - Editor]

TV INTERFACE FOR R7000

John Biro

I just got the video interface for the R7000, and to my surprise it is not an internal option. It bolts to the

---

1. Brian Kantor, WB6CYT. University of California San Diego. ARPANET address: brian@ucsd.edu

- 4 -

side of the radio (right side were the rubber feet use to mount). It is about 1 inch wide, and the same height and length as the R7000, and in a matching cabinet.

TV video is taken off the 10.7 MHz IF output jack, this presents a problem if you are using it for a Band Scope. It also "steals" the power from the IF output (the center pin of the IF out carries 12VDC so be careful not to short it out).

The interface provides RCA type jacks for both Video out and Audio out. The Video is standard levels and the Audio is low level output for input to a typical audio amp (it can not drive a speaker directly). I am not sure why the audio output is there as you can monitor the audio on the R7000, looking at the circuit they do have a sideband filter circuit so I would assume the audio is cleaner but I have not tried it and do not have any problem with the R7000 audio receiving WBFM from the TV stations.

Results: The TV-R7000 works OK, but I am just disappointed in the fact that it does not mount internally in the R7000. This could also help in its high price tag of $119. I had a Yaesu FRG9600 with video option (only about $30), and it worked about the same. The picture quality is good, and it is very stable. My antenna is vertically polarized, so I am working crossed polarized for TV stations but still get good results, strangely better on UHF then VHF freq. In fact, I get UHF on this set up better then my late model TV upstairs.

I think that I am most disappointed in the fact that the unit mounts on the side of the R7000. I don't have the extra inch of bench space, so I had to put rubber feet on the unit and lay it on its side on top of the R7000. It works fine and I do not see any difference with the case of each unit tied together or not.

I made a "T" adapter and ran both the BAND-SCOPE and TV on the IF output. I have not tried to add a third option to the IF output yet but it seems to be buffered from the main IF (wide band data 9600 baud).

The unit comes with schematic, installation info, and cables to hook it up to a video/audio monitor. Installation is 5 minutes or less if you know where to find your screw driver the only tool required.

Now to look for some Amateur TV and for Hidden TV stations. There is more out there then featured in the TV Guide.

- 5 -

198 CHANNELS FOR YOUR R7000 RECEIVER?

Copyright 1988 by Bob Parnass, AJ9S

[NOTE: This article was published in the April 1988 issue of The Radio Enthusiast.]

The ICOM R7000 appears to use a uPD446C, 16K static RAM chip, for storing 99 memory channels. By looking at the pinout of this chip (IC8 on the Logic Unit) in my service manual, it appears that ICOM is only using 1/2 its memory capacity. Address lead A10 (pin 19) is soldered to a ground pad.

To double the number of memory channels in the R7000 to 198, it looks like one could "lift" pin 19 of IC8, and connect it to pin 24 (+Vcc) through a 10,000 ohm resistor. A SPST switch could be used to ground pin 19.

Another challenge would be finding a place on the R7000 to put the added "Memory Bank" switch. Perhaps one could use the Noise Blanker switch, and just leave the NB on at all times.

I don't have time to try this experiment, and would be interested in hearing results from any enterprising hobbyist willing to try this.

Long live tinkering!

[PS: Jack Albert, WA9FVP, reports that he tried the modification, and it works! Jack doesn't have the remote control option in his R7000, so he elected to use the front panel REMOTE switch as a bank switch. He installed a 48,000 ohm resistor between IC8 pin 19 and ground, and ran a wire from the REMOTE switch, through an 82,000 ohm resistor, to pin 19. When you switch between banks, you must also rotate the channel selector knob, forcing to the microprocessor to read from memory.]

DOUBLE THE MEMORY CHANNELS OF THE ICOM R7000 BY REPLACING THE SPEECH SWITCH

by Jean-Louis Ecochard

This modification is based on information received both from Bob Parnass and from Gary on the ICOM Technical

Support line.

Although simple, this modification is rather delicate to implement because it requires knowledge of unsolder- ing and soldering CMOS components. It also involves removing the speech switch. This will of course void any ICOM warranty and the result may be a very expen- sive paper weight. It is very important to note that some vendors of ICOM equipment offer a similar modifi- cation for ~$50.

WARNING

THIS OPERATION INVOLVES UNSOLDERING ONE LEAD OF THE CMOS MEMORY CHIP. CMOS DEVICES ARE EXTREMELY SENSITIVE TO STATIC ELECTRICITY. USE THE APPROPRIATE EQUIPMENT SUCH AS GROUND STRAP, GROUNDED SOLDERING IRON, ANTI STATIC MAT TO MAKE SURE YOU WILL NOT DAMAGE THE CHIP.

THE SILK SCREEN REPRODUCTION IN THE ICOM R7000 SERVICE MANUAL IS INCORRECT, REFER TO THE FOLLOWING DOCUMENT CONCERNING LOCATING THE POSITION OF THE SPEECH SWITCH. CONTACT ICOM FOR MORE DETAILS.

Equipment

anti static mat
ground wrist strap
tip grounded soldering iron
solder (thin)
set of screwdrivers
unsoldering pump
set small pliers wire cutters

Parts

photocopy of the exploded view of the R7000 from the ICOM R7000 service manual
remote switch ICOM part # SPUT 19167A
47 K Ohms resistor
small insulated wire

Time 2 to 4 hours

Preparation

Read this document completely. Select a smooth surface to work on such as an antistatic mat or a towel spread on a

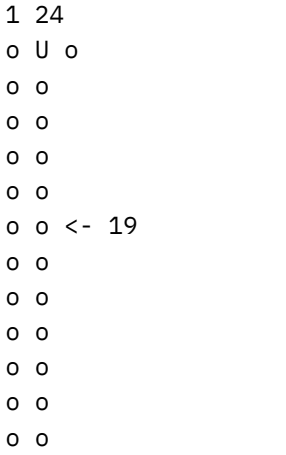
table. Put the R7000 in front of you with all the equipment you will need at reach. The receiver must be unplugged. For safety reasons and protection of your equipment it is advisable that you leave the ICOM unplugged for a couple of hours to allow components to cool and capacitors to discharge. Take off the front panel and the bottom panel as described in the exploded views of the service manual. Disconnect and take off the logic board (remember the connector positions). Disconnect and take off the SW3 board it may require disconnecting other boards.

The memory module

Locate IC8 on the logic board. It is the chip with the battery on top of it. Locate pin 19. Use the reference in the

service manual to find the correct pin labeled A10 (page 7-9).

Top view of IC8

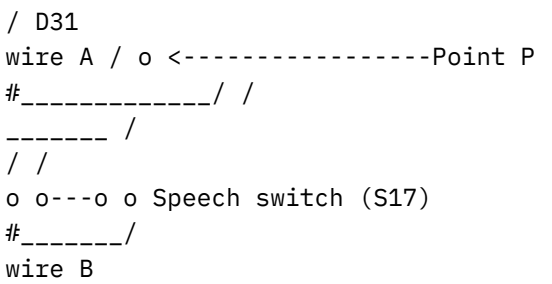


Now think on how difficult it will be to unsolder pin 19. If you think it is beyond your skills, get help. Unsolder pin 19 and use a pair of small pliers to pull it out of it hole. Make sure it does not touch the transistor nearby. solder a wire to pin 19. this wire must be long enough to reach the front panel later on. When this is done, verify that pin 19 is not in contact with anything (you may want to isolate it). You have done the most difficult part of the modification.

The switch board

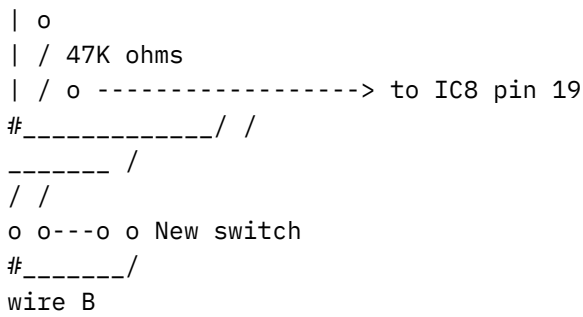
Locate the speech switch on the SW3 board. Beware, the ICOM service manual has incorrect information (reversed) concerning the placement of switches on SW3. The speech switch is S17. Locate the pattern/trace below on the solder

side of the SW3 board.



Unsolder the speech switch, the diode D31 and the wire A. Insulate the wire A so that it does not touch any- thing. Solder the 47K ohm resistor where the diode D31 was. Solder

the new switch (SPUT 19167A) where the speech switch was, in the same position. Solder the wire that you have previously soldered to IC8 pin 19 to Point P. Solder a wire between where wire A was sol- dered and ground. A good place to connect to ground is around the screw next to S18 on the SW3 board.



Verify your work and reassemble the unit.

Results

In the "out" position, the switch gives you the original 99 memories, in position "in" you have 99 more memories. These memories will be most likely full of garbage, so the first step is to clear them using the clear switch. Clear all the 99 memories. This modification also double the program scan mode memories. For example, you can have two programmed scan depending on the position of the switch when you do a "SET".

- 9 -

MODIFY YOUR ICOM R7000 TO SCAN AND SEARCH FASTER

Copyright 1986 by Bob Parnass, AJ9S

[NOTE: This article was published in October 1986 Monitoring Times magazine, page 28.]

This article describes how to increase the scan and search speeds of the ICOM R7000 receiver by 60% without noticeable performance degradation.

Background

The front panel SCAN SPEED control on the R7000 receiver allows the user to adjust the speed of scanning and searching operations, as well as the rate at which the priority channel is sampled. Rotating the control counterclockwise decreases the speed, and rotating it clockwise increases the speed.

When the SCAN SPEED control on my R7000 (serial number 001400) was turned fully clockwise, the radio would scan a maximum of about 8 channels/second, or search about 8 increments/second. As the following table shows, the stock R7000 can scan about as fast as a Radio Shack PRO-30 or PRO-2003.

Table 1. Maximum Scan Rates of Selected Receivers

Scanner	Maximum Scan Rate (channels/second)
Kenwood TR-2600	1.2
Radio Shack PRO-30	8
Radio Shack PRO-2003	8
ICOM R7000 (stock)	8
ICOM R7000 (after modification)	13
Regency M400	13
Bearcat 20/20	15
Bearcat 300	15

R7000 Scan Circuits

The scan rate of the R7000 is determined, in part, by a simple clock outside the microprocessor. The front panel SCAN SPEED rheostat and resistor R18 (and other components in the LOGIC UNIT) control the speed of this clock. The

clock output is connected to what appears to be an input port on the microprocessor. The upshot is that we can affect the scan rate without affecting the other chores performed by the microprocessor.

The modification consists simply of soldering a 470,000 ohm resistor across the leads of resistor R18 on the LOGIC UNIT circuit board.

How was the value of 470,000 ohms chosen? Experimentation with different resistor values showed that for values both above and below 470,000 ohms, the R7000 scan rate decreases. Not having the R7000 Service Manual, I assume this can be explained by the firmware within the microprocessor associated with the scan rate input port.2

Adding the 470,000 ohm resistor in parallel with R18, rather than just replacing R18, has a few advantages:

1. The modification is easily undone, returning the radio to stock condition.

2. The LOGIC UNIT board does not have to be removed, as would be the case if R18 was unsoldered from the foil side.

Making the Modification

Accessing this circuit board is not difficult, and involves the same steps used when installing the optional Remote Controller or Speech units.

Use a towel to cover your work area to avoid scratching the R7000 cabinet. Unplug the R7000 from the AC line, and turn the radio upside down. Remove the bottom cover by removing the 12 screws holding it in place.

Remove the 4 screws holding what ICOM terms the "partition panel". Pictures on pages 32 and 34 of the R7000 Instruction Manual show the partition panel. After removing this

---

2. Perhaps the firmware polls the scan rate input port infrequently. Another possibility is that the scanning pulses interrupt the processor, and the interrupt firmware is limited in its ability to process frequent interrupts.

panel, the component side of the LOGIC UNIT circuit board is accessible.

Locate R18, a 270,000 ohm 1/8 watt resistor, near connector J5. You may wish to remove plug P5 from J5 temporarily if it gets in your way. Carefully solder a 470,000 ohm resistor in parallel with R18. I used a 1/4 watt resistor as it was the smallest on hand.

Reassemble the radio, connect it to AC power and antenna, and enjoy.

In the modified R7000, the scan and search rates are still adjustable using the SCAN SPEED control. With the control turned fully clockwise (maximum speed), the modified R7000 scans at about 13 channels/second and won't miss weak signals.

A LOW COST PANADAPTOR
FOR THE R-7000

Copyright 1987 by Bob Parnass, AJ9S

[NOTE: This article was published in the July 1987 issue of The Radio Enthusiast and the March 1988 RCMA Newsletter.]

A panadaptor, or spectrum display, is a device which portrays visually the signals in a part of the radio spectrum. Panadaptors allow radio listeners to "see" activity on a portion of band without requiring the listener to tune the receiver.

They are useful for detecting the presence of spread spectrum signals or "hidden" signals riding on a subcarrier of a main channel. Panadaptors are invaluable for detecting spurious emissions from transmitters, and unwanted products caused when 2 or more signals mix.

Panadaptors most often employ a cathode ray tube (CRT) for the display, and must be connected to the intermediate frequency (IF) amplifier stage of a receiver, at a point before filtering takes place.

The ICOM R-7000 2-2000 MHz receiver rear panel has a phono jack for wide band 10.7 MHz IF output. A DC voltage is also present at this connector and is used to power an ICOM TV accessory.

- 12 -

I've seen mention of 3 panadaptors for the R7000:

1. John Biro's article on retuning a Yaesu YO901 Multiscope panadaptor for 10.7 MHz, restricted bandwidth use. Selectable bandwidths of 20, 100, or 200 KHz are available.

2. The Sherwood Communications SCA-7000 signal monitor, priced at $1600, and reviewed in May 1987 "Monitoring Times".3 Bandwidth adjustable from 1 KHz - 1 MHz.

3. The Spectra-Display, priced at $350, which requires use of an external scope.4 Bandwidth adjustable from 200 KHz - 10 MHz. Optional preamplifier required for 12 MHz wide sweep.

In the past month, several Kenwood SM-220 monitor scope/panadaptors have appeared at hamfests selling in the $200 to $250 range. The Kenwood SM-220 can display transmitted or received signals. To add spectral display capability to the SM-220, one must purchase the optional BS-5 or BS-8 module, which consist of a printed circuit board, a steel enclosure, interconnecting cables, and a new graticule. The panadaptor module mounts inside the SM-220 cabinet.

The BS-5 is used with the TS520 and TS530 transceivers, which have an IF of 3.395 MHz. The BS-8 is used with the TS820 and TS830 transceivers, which have an IF of 8.830 MHz. Since the IF of the ICOM R7000 is 10.7 MHz, one must

alter the panadaptor circuitry to accept 10.7 MHz input.

If you have any choice in the matter, get the BS-8, as it requires fewer changes than the BS-5, and may even require no changes at all!

The panadaptor module circuit consists of several stages, but only two are directly related to the IF frequency:

1. A crystal oscillator is used as a marker generator.

---

3. Sherwood Communications, 1310 Industrial Highway, Southampton, PA 19866. tel (215)357-9056.

4. Spectra-Display is sold by GTI Electronics, RD 1 Box 272, Lehighton, PA 18235. tel (717)386-4032.

2. A voltage tuned oscillator is swept across the IF of the receiver, and employs a varicap diode, an inductor and capacitors.

The marker generator is not vital for panadaptor operation. It merely provides a single "pip" that one may use to center the display on the CRT screen, and is similar in purpose to the crystal calibrator in older receivers.

The marker generator circuits in the BS-5 and BS-8 are identical except for one crystal. One need only replace the 3.395 MHz crystal (in the BS-5), or 8.830 MHz crystal (in the BS-8) with a 10.7 MHz crystal to adapt the SM-220 marker to 10.7 MHz IF. I did not alter this stage, although I would if I had a 10.7 MHz crystal handy.

The voltage tuned oscillator is the stage that deserves our attention. The changes required depend on whether you have the BS-5 or BS-8 panadaptor module.

Changes for BS-5 Module

Change the following capacitors:

1. C231 from 1000 pf to 68 pf.

2. C232 from .01 uf to 1000 pf. (You can use the capacitor which used to be C231.)

3. C234 from 100 pf to 22 pf.

4. C236 from 47 pf to 22 pf.

5. C237 from 680 pf to 100 pf. (You can use the capacitor which used to be C234.)

Solder a 10 microhenry inductor in parallel with L204, a 20 microhenry inductor.

Changes for BS-8 Module

I haven't tried the BS-8 module, but encourage you to try using it as is, without modification unless necessary.

These steps are needed only if you cannot find settings of the side mounted aligment controls that get the display to behave as specified in the owner's manual:

- 14 -

1. Remove C233, the 33 pf disc capacitor, from the printed circuit board.

2. Replace coil L204, the 4.7 microhenry inductor, with a 6 or 7 microhenry inductor.

Alignment

Follow the alignment procedure in the SM-220 owner's manual to adjust the panadaptor. This consists of adjusting 2 potentiometers and 1 trimmer capacitor through holes thoughtfully provided in the side of the cabinet.

The alignment instructions rely on the use of the internal Marker Generator to generate a signal at the center of the passband. If you haven't converted the Marker Generator circuit, you can tune your receiver to a frequency with a signal present at a known frequency (like 162.550 MHz - the National Weather Service), and use that as a frequency standard.

Most of the time spent in aligment will be in alternate adjustments between the trimmer capacitor and the wide band sweep potentiometer, which interact with each other.

Wider Bandwidth

The SCAN WIDTH switch on the stock SM-220 can be set to display a 40 KHz or a 200 KHz wide picture. I adjusted my modified SM-220 to display a 100 KHz or a 500 KHz wide picture. By adjusting the controls on the side of the SM-220, wider bandwidths are possible, but wider bandwidths make it more difficult to resolve individual signals close to each other in frequency. As the bandwidth gets wider, the horizontal sweep loses linearity, causing the graticule calibration lines to be inaccurate.

Connection to R-7000

As mentioned earlier, a DC voltage is present at the R-7000 IF output connector and is used to power an ICOM TV accessory. A direct connection between the R-7000 IF output

connector and SM-220 would damage at least one of these units.

To block the DC voltage, a 0.1 microfarad capacitor was soldered inside the R-7000, between the IF output jack and the adjacent jack labeled "spare". Connection between the

- 15 -

R-7000 and SM-220 is then made using a short length of RG-58/U coaxial cable, with one end plugged into the R-7000 "spare" jack, and the other end plugged into the rear of the SM-220.

This leaves the original IF output jack undisturbed so it can be used with the TV adaptor accessory.

Vertical Sensitivity

When I connected my modified SM-220 to my R7000, the SM-220 would display only the strongest of signals. To improve the display sensitivity, I inserted a 20 dB gain RF amplifier between the R7000 and SM-220. The amplifier was a spare Ameco PLF2 FET receiver preamp, adjusted for 10.7 MHz, but other amplifiers can be used, provided they have at least a 500 KHz bandwidth, and sufficient gain, at 10.7 MHz.

False Readings - Images

The SM-220 circuit is like a superheterodyne receiver. The panadaptor itself has a 455 KHz IF, and like other superheterodyne receivers with a low IF frequency, is prone to images.

An image is manifested as a false pip, which moves across the screen as the receiver is tuned, and is 910 KHz (twice the IF) away from the actual signal.

The images discussed here are in the SM-220, not in the receiver. Images are bothersome on the strongest signals, like those 300 watt paging transmitters that saturate the county with RF, belching out out strange digital noises or voices (now illegal to monitor).

Use With Other Receivers

The modified SM-220 can be used with other receivers having a 10.7 MHz IF. In other receivers, one would need to find the proper point in the IF stage (before filtering takes place), install a connector, then wire a DC blocking capacitor between the IF stage and connector.

- 16 -

WIDER FM FILTER IN THR R-7000

by Barre Ludvigsen

I am trying to replace one of the 10.7mhz IF 150khz FM filters of my ICR-7000 with an XF-107E (40khz) wide crystal filter from Spectrum (the type designator is from memory) for better APT reception.

Right now I am using the 150khz bandwidth which works, but gives me some interference. I have tried to insert the 40khz filter i // with the 150 using a switching circuit similar to those used in the narrow FM filtering schemes, but the new filter seems narrower than 40khz and gives excessive noise.

The reason I want to use a switchable circuit is to retain the 150khz bandwidth for broadcast FM and audio through the radio when using the TVR-7000 unit. I suppose I could for-sake broadcast and take the TV audio out of the TV unit, but switching would be nice.

Memory Scan Using the R-7000 Remote Control

by Johnathan Vail, N1DXG
Tegra-Varityper, Inc., Billerica, MA

Here are the details of a mod I sent to MT a few years ago:

This will change the function of the MS key on the remote control to select SELECTED MEMORY SCAN instead of MODE scan. Why they didn't provide this as a function in the first place seems rather odd.

On the remote control option board inside the R7000, remove the cathode of D40 from the board and bend the diode up

slightly. Attach a small wire, like #30 wire-wrap or some-thing, to the lifted cathode and tack solder it to the cathode of D32.

You could do this with cuts on the board but the tack solder method allows the mod to be backed out easily if needed.

An alternative method is to run the wire from D40 through
the hole where it used to be, and solder to the gray wire
(pin 8) of P1.

I figured this out with a scope and the schematic. The
switches are all polled by the CPU through a diode matrix.
Lots of combinations are possible but I didn't fool around
too much.

RG-6 satellite cable, good for scanners, beats RG-58, RG-59, and RG-8 hands down; on sale for 9-cents a foot in quantity from:

MECI, Inc
meci@meci.com
(800) 344-4465

MECI is an interesting supplier of all sorts of surplus electronics stuff of interest to the dedicated scanner hacker.

Another resource of some possibility is:

MCM Electronics
(800) 543-4330

Rgds,

Bill

Here, this is what you shouldn't do:
(So you know what key sequences you are NOT allowed to press, by law.)

OKI 900 - TEST MODE

Power the phone up. Wait for PowerOn msg. Hit 7 and 9 together.Then hit Menu, Snd, End, Rcl,
Sto, Clr.
Phone says 'good timing!' Debugger is now enabled, but phone works normally.
Hit 1 and 3 together to halt phone and enter debugger. Everything on display lights up.
Hit Clr, Clr till you get status display.

Now you can execute commands listed below. For example to reboot phone enter #, 0, 2, Snd.
Commands all start with # and end with Snd. Some take arguments.

You can use #25, to display memory in EEPROM, and once in that command, you can hit # and * to go up and down in memory, Clr to exit. Hex chars are entered as "*n", like *1=A, *2=B, etc.

SUSPEND #01 Performs Initialization
RESTART #02 Terminates the test mode
STATUS #03 Shows current status of TRU
RESET #04 Resets the autonomous timer
TURNAROUND #05 Returns Data Bytes following command to the Test Set.
INIT #06 Initialize the TRU to following states:
Carrier Off, Attenuation - 0db, Receive Audio Muted
Transmit Audio Muted, Signalling tone off,
Autonomous timer reset, SAT off, and DTMF off
CARRIER ON #07 Turns the carrier on
CARRIER OFF #08 Turns the carrier off
LOAD SYNTH #09XXXX Sets the synthesizer to channel XXXX
SET ATTN #10X Set the RF power attenuation to X

0 = 0db, 7 = -28 db (in steps of -4db thru 7)
RXMUTE #11 Mutes the receive audio
RXUNMUTE #12 Unmutes the receive audio
TXMUTE #13 Mutes the transmit audio
TXUNMUTE #14 Unmutes the transmit audio
RESETOFF #15 Discontinues resetting of autonomous timer
STON #16 Transmits a continuous signalling tone
STOFF #17 Stops transmission of signalling tone
SETUP #18 Transmits a 5 word RCC message (fixed text pattern)
VOICE #19 Transmits a 2 word (RCC) RVC message (fixed test pattern)
RCVSU #20 Receives a 2 word FCC message (cancel with 0x38)
RCVVC #21 Receives a 1 word (FCC) FVC message (cancel with 0x38)
SEND-NAM #22 Returns the information contained in the NAM
VERSION #23
SEND-SN #24
MEM #25XXXX Displays the resident memory data at
00XX=in micro, XXXX=EEPROM
WSTS #28 Count 1 word messages on CC, until TERMINATE
WSTV #29 Count 1 word messages on VC, until TERMINATE
SATON #32 XEnable the transmission of SAT X
0= 5970 Hz, 1=6000 Hz, 2=6030 Hz
SATOFF #33 Disables the transmission of SAT
CDATA #34 Transmits 5 word RCC message (30 bytes)
HITNON #35 Activates the 1150Hz tone to receive audio line
HITNOFF #36 Deactivates the 1150Hz tone
LOTNON #37 Activates the 770Hz tone to receive audio line
LOTNOFF #38 Deactivates the 770Hz tone
DTMFON #42XX Enable the transmission of DTMF frequency XX[2]
DTMFOFF #43 Disable the transmission of DTMF
? #44, #45, #46, #47, #48, #51, #52, #53.

The reason no has pointed it out is because that statement is untrue,
and has been hashed out in this group many times before. Morse code is really
On-Off Keying with a Morse encoding of simple text. With this in mind we
take the OOK by itself, since the Morse encoding does not offer much gain
compared to standard encodings(The ability of operators to pull meaning out of
a corrupted message is contextual gain, which is independent of how the
message was sent).
With OOK by itself we can actually look at the error rate vs S/N. It
turns out the OOK has the same error rate as non coherent BFSK for the same
S/N (see Sklar's "Digital Communictaion"). With NCBFSK being the eclipsed
by M-ary cohereht FSK in this respect, we can see the OOK is not the most
robust mode. Add in time diversity and coding gain and OOK Morse code is
not as good as NCBFSK.
Sure it can be argued that CW OOK has the simplest equipment, but
coherently detected BFSK isn't all that hard, and it can be made very
robust.

: 13wpm to have access to the majority of ham HF frequencies?
: Cheers, --
: Bill Sohl K2UNK (Budd lake, New Jersey) (billsohl@planet.net)
: ARRL Local Government Liason, Mount Olive Township
: --

I believe it's one way of ensuring that unscrupulous types don't
operate on lower frequencies where RFI can do the most harm. This
may not be the best way of going about it, but that's the way it's
looked upon now. In the future I'm sure the code requirement will
be dropped.

By the way, I haven't received my HF privileges yet, but I aggree
with the policies and am working on my code in hopes that I can
earn my advanced ticket. (for those who were wondering)

: You can hear lots of interesting things.
: Many of the conversations are funny becaue someone is pissed off and
: swearing his head off. Fights between husband and wife,
: girlfriend/boyfriend. Transfers of money, stocks etc.
: During the day mostly business calls, you can get the tips on where to buy
: the latest computer gadgets for the best price. All kinds of
: useful/useless information. In the evening it's like a soap opera, you
: peer into the lives of real people instead of watching the tube. I'd say
: it's good wholesome entertainment.

the novelty for cellular monitoring wore off in about a month after I got
my 1000xlt when it first came out. I dont really monitor it anymore
because most of the conversations are inane, boring. I would not
personally drive my self nuts trying to modify a scanner for 800Mhz.
there is more intresting stuff to be heard on the private detective
frequencies.

Another modification on this theme...I bought one of those "baby monitors" from radio shack and modified the base unit by installing a jack that cuts out the internal mic. I took a simple
audio patch cord with an attenuator on it (all available from Rat shack for a couple of $$$)
and plugged the headphone output of my base scanner into the monitor. Then you can take the portable rec'vr with you anywhere in the house and still have the benefit of listening to you
scanner which has the better antenna. I sometimes do this when monitoring a big fire (all fire
depts here are simplex) since I can hear the transmissions better from the base scanner than on
a portable scanner.

For the most part that's certainly the case. the majority of cell calls
are inane conversation between teenagers with too much money & time on
their hands, and your typical "what's for dinner". Occasionally tho,
you'll pick up the stray illegal activity, extramarital scheduling, etc.,
that makes listening attractive for some.

Needs no encryption. Because, no one will ever figure it out, right?
Isn't that what they said back in 82 when they decided NOT to encrypt
data on analog phones? It's only a matter of time before someone figures
it out.

1453. Re: UNIDEN WANTS TO KNOW....

Source record: 242323

I would like to see Uniden develop a scanner (portable and base) that is capable of receiving LTR and Ericsson's EDACS trunking formats. This is possible from what I understand especially for the EDACS since Uniden's Commercial Two-Way division has been granted authority from Ericsson to begin manufacturing equipment using EDACS trunking logic. In a conversation I had with a Uniden Two-Way and scanner dealer the rep told me that this may be in the works for their scanners too or some sort of a Uniden add on accessory that would add trunking logic so if this is the case by all means please do. We scanner users must realize that if this were to become a reality that we have only won half the battle because we would still need to find out the talkgroup and system codes in order to make our scanners "trunk" and you don't think the two-way dealers are going to help us out do you? Just my opinion.

I too used quality components in the construction. I also used a 10 turn
trimpot for the adjustment potentiometer (or was it a 3 turn?). This allowed
me a finer granularity for better adjustment capability.

I basically had to find a LOUD voice conversation, and while looking at the
output and listening to the results, I could define an upper limit to the

control. Then, finding a trunked-system control channel, I repeated the procedure to define a lower limit to the control.

Once the lower and upper limit of usability was defined, I simply set the pot mid-way between these extremes. Now, 99% of voice signals will fail to false the circuit, and when the scanner lands on a control channel, it will only stay there for about one second, then will continue scanning.

I decided to try this circuit after modifying my Pro-2006 for a tape-recorder control output (basically a squelch-operated relay) with a channel activity LED. If you are going to park a scanner on a specific band search unattended and want to record traffic, the worst thing that can happen to you is landing on a control channel and recording an hour of "buzz"! The Data Squelch circuit makes sure this doesn't happen.

Steve

1455. Orange Co.,CA, Ambulance freqs?

Newsgroup: rec.radio.scanner
Date: 1996-01-17 00:00:00 UTC
From: Firefox@quick.net
Message-ID: <Firefox-1701960059180001@205.153.188.107>
Source record: 242325
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Most of the ambulance companies which serve Orange County, CA, have been bought out by, or merged with, other companies in the last couple of years and I'm not sure who is using what frequency anymore.

Based on current telephone directory information and FD contract service information, I have come up with the following list of private Ambulance Co.s which serve Orange County.

If anyone can confirm or update the frequencies listed, or provide frequencies for those I don't have, please post and/or E-mail this info.

BTW, the cities of La Habra, Orange, Huntington Beach and Santa Ana provide their own fire department ambulance service, and the Orange County Fire Authority contract cities of San Clemente and Westminster also have Emergency Transport ambulance service.

Also, the Ambulance compancies listed in the Southern California edition of Police Call for Santa Ana continue to be very erroneous. Both Conva Care and Comfort Coach have not existed since the early 1980s, and Morgan (aka K&M) Ambulance has also been gone for ages.

ORANGE CO., CA, AMBULANCE COMPANIES (as of 1/96):

1. Bowers Ambulance, Garden Grove - Freq. = 47.62 MHz

2. Care Ambulance, Anaheim - freq. = ??
(note: NOT the same as Careline)
3. Careline Ambulance, Buena Park - freq. = 45.96 MHz (confirmed)
(note: formerely was Lifefleet and before that Southland. It was just bought by the corporation that owns Med-Trans, so it may change again).
(Contracts for large portions of Orange County, both north and south)
4. Doctors Ambulance, Laguna Hills - freq. = 155.205 MHz (confirmed)
(has contract for Tustin, Irvine, El Toro, Lake Forest, Laguna Hills)
5. Emergency Ambulance, Brea - freq. = 155.16 MHz ?
(has contract for Brea)
6. Lifecare Ambulance, Laguana Beach(?) - freq. = 47.46 (confirmed)
(has contract for Laguna Beach and Newport Beach)
7. Lynch Ambulance, Fullerton - freq. = ??

8. Med-Trans, Costa Mesa - freq. = 155.16?
(bought out Seals Amb. Contracts for Costa Mesa, Fountain Valley, Newport)
9. Medix Ambulance, Mission Viejo - freq. = 155.22? (moved to 800 MHz?)
(has contract for Villa Park, N. Tustin, Mission Viejo)
10. Schaefer Ambulance, Santa Ana - freq. = 47.58?
(been around along time, but do they have any contract area in OC?)
11. Superior Ambulance, Santa Ana - freq. = ??

(also around for a long time?, but do they have any contract area in OC?)

What's the matter, isn't the AEA software upgrade to ACARS cheap enough for you? What you appear to be asking for is an illicit copy of a commercial software program that is readily available through AEA dealers.

>
>Why would somebody go through the time to unsolder and resolder their
>scanner to hear somebody's conversation? Do people talk about more than
>"Whats for dinner" ?

Cellular conversation pretty much follow the same lines as land-line
communications. Most people are pretty frugal about their cellular
conversations cause it is more expensive as LL, at least I know that I am.
I try to keep my calls to under 1 minute and not more than two. Week ends
are a differnt story since my air time is free.

Cheers

Brian

Will you people
PUULLLLLEEEEEEEEEEZZZZZZZEEEEEE
leave this subject alone?

These two people (Cheek and Moss) are both very immature,
and quite frankly, appear to need psychological counseling.
It would be best if you simply bypass the ranting, raving,
immature posts of these two and go about your business.

Whereas they both may have been a positive contributor
to this forum in the past, neither is that now.

Maybe if you ignore them, they will both simply go away.
This forum will be the better for it.

>Is there any way to connect a battery to my system for use during
>emergencies?

Go to Wal-Mart and get their low-end car battery. It will cost you about $30 or so, plus about $10 for a small "trickle charger" to keep the battery charged. With this set-up, you will be able to run your scanner for weeks on end, or for longer than the power is ever likely to be off! <g>

This method is also great for operating CBs, 2-meter ham radios, etc.

I bought a Bearcat 2500xlt back when they first came out. It's a pretty good scanner but the battery drain time and loud squelch tail are a pain. I've been out of the main stream for a while, but now I hear that there may some mods...

I've also heard that Uniden will fix these problems under warranty, but mine has long expired.

ANY info would be greatly appreciated!!!!

Thanks

Jeff Johnston

..*>Dave Bernazzani

Dave, what you're thinking will work just fine. If any unit has a 12-13.8 VDC input for it you can connect it to a
separate battery and use it that way also. A small motorcycle battery or even a camcorder battery would work although
the camcorder battery would probbaly drain down a bit faster.
If your scanner drains less than 500 ma then you should be able to power it for several days on a full size car battery.

I have a nice Mitsubishi 4000 portable cellphone with several battery packs, car charger, wall charger, leather case, programming information, hands-free adapter for car that I would like to trade for a BC2500XLT in good condition.

The phone is in great condition, very small (7.9 oz) 99 memories, two line LCD alpha numeric display, tone messaging, etc. Multiple NAM (4). It was the best portable that Mitsubishi made until they replaced it with the 4500 the end of last year.

Please call Michael at 619-535-3476 for more info.

Here are some freqs from FAA publication for Cleveland ARTCC (Center),
which, because of the geographic location, is one of the busiest centers
in the US.

Algonac 134.3 132.25 Belmont 135.175 132.45 120.4
Blue Knob 128.45 124.4 121.2 119.925
Bradford 124.325 Carleton 134.775 119.95
Chardon 120.775 Detroit North 128.35
Dunkirk 125.2 Findlay 135.1 133.8
Flint 126.75 Holland 135.775 121.175

Jackson 127.3 Litchfield 135.725 134.65 120.45
Mansfield 134.9 133.375
Morgantown 126.95 Moon Township 133.075 126.95
Mt Hope 120.6 Paris 128.15
Saginaw 133.525 127.7
Sandusky 132.45 120.775 127.9 119.325
Warren 132.925 135.125 121.4 119.725
Waterford 132.4 Waterville 123.9

Suggest you put in the freqs for areas that are closest to you first,
as you'll get more hits that way.....some of these are remoted some
distance from Oberlin.
Good Luck.....Bob, the FAA drone.

UNIDEN/BEARCAT 100XLT SCANNER REVIEW

Copyright 1988 by Bob Parnass, AJ9S

[NOTES: This article was published in the March 1988 issue of The Radio Enthusiast. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

The new 100XLT is manufactured in Taiwan, and looks nothing like the 100XL or the original Bearcat 100. Rather, it looks identical to the 200XLT that everyone's asking about - tall, thin, and entirely gray plastic. It is lighter than the Regency HX-1000 series, but not as rugged.

The differences between the 100XLT and the future 200XLT are in 800 MHz band coverage and number of channels (100 vs. 200). It's easy to envision UNIDEN adding a small 800 MHz converter board and an extra diode to make the 100XLT into a 200XLT.

The "real" volume and squelch knobs on top are a welcome change from the side mounted, dust vulnerable knobs on the 70XLT.

The closely spaced keys on the 100XLT keyboard are made of soft rubber, and are well labeled. Marshmallow-like keys, combined with fat fingers, require extra care when entering frequencies. There is no "beep" tone to confirm key depressions, so you must watch the display to make sure you pushed the keys far enough.

Memory Organization

The 100XLT's strong point is the amount and organization of its memory. The 100 memory channels are divided into 10 channel banks.

Of course, 100XLT banks and channels may be selected or locked out. The banks are "hard partitioned," just like Bearcat scanners of old. By this I mean, Bank 1 includes channels 1-10, Bank 2 channels 11-20, etc. Regency is using "soft partitioned" banks in their HX1500 and TS2 models, but the peculiar Regency system prevents channels

from being locked out during a bank scan.

A bank size of 10 channels seems just about right. Bigger bank sizes, a disturbing trend, means less flexibility in choosing what to scan and what to ignore.

Historically, programmable scanners had banks of 8 or 10 channels. Two years ago, UNIDEN introduced the 800XLT, with 2 banks of 20 channels. Then Radio Shack introduced its PRO-2004 with 10 banks of 30 channels. Large channel banks do have their place, particularly when scanning 800 MHz trunked systems, and the sparsely populated 225-400 MHz military air band.

Banks aside, having 100 channels means no longer having to settle for 10 or 16 most favored frequencies when away from home. Now you can bring it all with you - program up 10 channels for cordless phone listening, 10 for metropolitan police, 10 for county sheriff and fire, 20 for listening to Uncle Sam, 10 for ham frequencies, 10 for business, 10 for aircraft, and 20 left over for trial-and-error searching! The 100XLT scans at 15 channels/second, about twice as fast as Radio Shack's top of the line PRO-32.

When the 100XLT is powered on it always comes up scanning with priority off.

The LCD display panel contains all the usual indicators, and can be back lit for 15 seconds with a green light when the proper button is pressed. But the LCD contrast is mediocre, making it difficult to read the display at various angles.

Innovations

The 100XLT feature set includes new surprises. The first channel of each active bank is a priority channel, making 10 priority channels in all. There appears to be 10 levels of priority, for example, channel 1 priority takes precedence over priority channel 11, which takes precedence over priority channel 21, etc. When the priority is switched on, the 100XLT samples all the unlocked priority channels (in active banks) every 2 seconds.

The priority sampling does appear to "chop up" signals a little more than on older models that sample only a single priority channel. When the power is turned off, then on again, the priority key must be pressed manually.

Let's see, did I program in that new K-Mart frequency, 154.6 MHz somewhere? Just type 154.6, ENTER when positioned to a channel you don't care about, and the LCD will display "CH 29", for instance, if you already have

154.6 MHz in channel 29.

Stated a different way, if one tries to type a frequency into the 100XLT that has already been programmed in another memory channel, the display will flash in which channel it has been programmed. One can override by depressing ENTER again, and the frequency will be stored in the current channel.

This is a great feature, especially in a scanner with so much memory.

There is a single button to search all VHF NOAA weather channels, a feature becoming commonplace among newer UNIDEN scanners.

Battery Pack Mislabeled

The 100XLT comes with a BP-205 7.2 V battery pack which slides onto the bottom of the radio. There is a charging jack, marked 12 VDC, and a red charging LED on the back of the pack. The pack is not supposed to be opened, but the curious need only remove 2 screws. Inside, are the charging components (regulator circuit), and 6 AA size Sanyo cells wrapped in yellow heat shrunk plastic.

Opening the battery pack reveals an interesting contradiction. The label on the outside of the pack claims 600 mAH capacity, but the Sanyo batteries inside are marked 550 mAH.

When you buy the 100XLT, the 16 hour wall charger adapter is supplied, and is marked 12 VDC 500 mA. There appears no way to fast charge the supplied NiCd pack, and the manual cautions against leaving the supplied charger plugged in for long periods of time.

The radio can be used with the wall charger when the batteries are dead, but unlike older crystal controlled portables, there is no easy way to power the scanner externally, without charging the internal battery.

A PS-001 mobile power cord is available for $4 from UNIDEN, as is a spare antenna.

The owner's guide says to expect "up to 5 hours of dependable use" between charges. Now 5 hours isn't enough for many scanner buffs, but perhaps UNIDEN's idea is to stimulate demand for extra BP-205 slide-on battery packs ($30). My 100XLT was used for about 7 to 8 hours before the battery indicator began to flash. The radio began its power down cycle shortly thereafter.

Memory Backup:
A Potential Problem?

Having 100 memory channels is great, especially when thoughtfully partitioned into 10 banks. It takes time to program a scanner with so many channels, so you wouldn't want to do this often.

According to the owner's instructions, the 100XLT's memory is only backed up for 30 minutes by a capacitor. UNIDEN advertisements put this figure at 1 hour - no accounting for the contradiction.

Take the scanner outside for an afternoon of fun. When the BATTERY warning blinks, do you have only 30 minutes to find an AC outlet? The manual claims the scanner will shut itself down automatically if the warning has been flashing for 10 minutes, but it's not clear how "dead" the NiCd is by then.

Are memory contents lost that easily? To experiment, I used the 100XLT until the warning flashed and the set powered itself down. Instead of recharging the battery, I spent the next day turning the 100XLT on and using it for a few seconds until it shut itself off. About 24 hours after the first sign of a dying battery, the memory contents were still intact.

It is important to note that I left the battery back connected at all times, so any amount of residual voltage would available to the memory backup circuit.

The next test was more grueling. I disconnected the battery completely from the radio to see how long the memory would last. The 100XLT passed the test with flying colors: after 16 hours, the memory was still intact.

Great Audio

The audio output is rated at 480 milliwatts, but who believes manufacturers' specifications any more? The good news is that the 100XLT sounds great! There is plenty of undistorted audio available from the front speaker, making a Radio Shack PRO-30 sound like a whisper.

Inside Construction

The internal construction of the 100XLT is clean, but thoughts of home repair vanish as soon as one opens the 100XLT case. Tiny surface mount components abound. You won't find these parts at Radio Shack, and you wouldn't want to solder them in anyway.

The 2 main circuit boards are surrounded by an internal metal frame, and a few small circuit boards are mounted

vertically on the main audio/RF board.

I did see what appeared to be "jumper" diodes, but resisted the temptation to cut them. Maybe one expands memory capacity to 200 channels?

Judging from the filtering and local oscillator crystal inside my 100XLT, the first IF is 10.85 MHz, and the second IF is 450 KHz.

How Does It Work?

UHF sensitivity is very good, and sensitivity in the AM aircraft band appears adequate.

Using an outside antenna, the 100XLT is sometimes bothered by the obnoxious 300 watt paging transmitter nearby, but so is my 800XLT on an indoor whip. Expecting a portable scanner to behave well on an outside antenna may be asking too much.

Most every superheterodyne receiver has birdies, those places on the dial where the receiver "hears itself." The 100XLT owner's guide does not list birdies, but I counted 30 throughout the entire frequency range:

31.2, 39.59, 40.7, 41.6, 51.1, 52.0, 122.075, 123.075, 124.8, 129.4, 134.375, 141.665, 143.775, 144.77, 145.6, 146.5, 158.16, 165.48, 166.4, 166.475, 167.3, 424.8125, 425.1125, 434.3125, 434.325, 456.025, 470.65, 482.575, 488.8375, and 504.275 MHz.

Many of the birdies are weak, and disappear when the heliflex antenna is replaced with an outdoor antenna.

Images of stations in the UHF range were noted 21.7 MHz higher than their assigned frequencies.

What You Get

The 100XLT comes with a good leather-like case, on par with the original BC100 case, and heavier than the skin-tight glove furnished with the Regency HX-1000 series. The case has openings in all the right places, so one can charge the battery without removing the radio from the case. There is a belt loop sewn on the back, but a user must unfasten his/her belt to thread it through the loop, a decided inconvenience.

The 100XLT also comes with a wall charger/AC adapter, an earphone, and what appears to be a VHF high band heliflex antenna. The antenna is blessed with a BNC connector.

UNIDEN scanners no longer come with an owner's manual, but with a fold out sheet instead. The instructions aren't great, but will tell you most of what you need to know. Of course, you don't get a schematic, but you order it for $1.1

Who To Call

There are 3 UNIDEN/Bearcat telephone numbers 100XLT owners may find useful: Product Information: (800)722-6637, Repair: (317)842-2483. Parts: (317)842-1036.

Be persistent. The Product Information line can ring a dozen times before someone answers, and the other phone numbers are often busy.

Summing Up

The UNIDEN 100XLT works well. It scans fast, sounds good, and excels in the amount and organization of its memory channels. The multiple priority, frequency finding, and slide-on battery pack features also set this scanner ahead of others.

The more I use the 100XLT, the more I like it.

If you had been following this newsgroup for a while, you wouldn't be surprised that no one is claiming OOK Morse as the most robust mode. That's because it isn't, and that fact has been explained here at length numerous times. There are a number of digital modulation techniques, and digital codes, which are quite a bit better than OOK Morse for getting through under harsh conditions.

Rather than rehash what has gone before, I'll simply refer you to Stephen Wilson's _Digital Modulation and Coding_ [ISBN 0-13-210071-1] for a concise and complete explanation of why OOK Morse isn't the most robust mode. A more exhaustive explanation is available in _Digital Communications Techniques, Signal Design and Detection_ by Simon, Hinedi, and Lindsey [ISBN 0-13-200610-3]. I highly recomend both of these books for those who wish to understand what it really takes to operate effectively in harsh channel environments.

>conversations cause it is more expensive as LL, at least I know that I am.
>I try to keep my calls to under 1 minute and not more than two. Week ends
>are a differnt story since my air time is free.

It was kind of slick over the New Year's weekend, I heard a guy dial
in a 911 on a DUI driver, and about 10 seconds after he hung up, the
police were being dispatched. A lot of people complain about how long
the police take to get to their location, but this just proves that
they are working as fast as possible.

Absolutely! That 12v battery will work just fine. That's what your
adapter for the car does, anywhy: it just connects to the car's battery.
Just make sure the wires from the scanner to the battery have an in-line
fuse installed, to protect things.

>priviously in this group, but I did'nt own the unit then and don't know
>what the general consenses turned out to be.

I remember hearing about something very similar..

>Do all 2006's hum?

I would guess that only the dull ones do.

>Does this indicate a problem with the AC transformer?

My guess is that the radio is not programmed, and therefore it has to
hum because it does not know the words. I suggest giving it some Led
Zeppelin, then it won't hum, rather you'll hear Palmer, much more pleasing.

>Would I be better off using a DC power source, and if so how do I work
>that out?

Oh dear... If you like AC/DC I guess they're okay, choose your own
liking. The hum might be better, however..

>Thanks for any help.

From: sreider@hamlet.umd.edu
Message-ID: <4dmbns$1a6@hamlet.umd.edu>
Source record: 242157

A while back someone posted that the Opto 456 installation manual was incorrect.
They were correct !
In my manual it says to hook one of the leads to pin 12 or 11 , but the picture shows the connection to pin 16.
All along I've been connected to 11
I could never figure out how to get the spectrum display to work on scanstar.
I would get a hit and the line would continue across the top of the chart.
After changing to pin 16 the hit spikes and returns back down.

Thanks whoever that was, Thats what this group is about , not knit picking and price policing and bickering like kindergardeners.

Anyhow thanks whoever.

Richard Reider.

Hello, I'm getting a new RS scanner and I need to get some ni-cads. do they still suffer from memory problems when charged after not being fully disharged. They sell chargers that also drain the batteries down fully before recharging them or is the charging circuit in the scanner good enough to keep the battery charged?

Thanks for any help

1489. Re: Vote here in Favor of Bill Cheek

==========
Ok, some *real* advice: buy a new plastic piece, and install it.
Or....
First, polish the LCD cover with some toothpaste, followed with something
like BRASSO, to get it good a smooth.
Then, cover it with some clear plastic laminate (that thin, flexible
plastic sheet stuff with stickum on one side). This can be removed when
it gets scratched, and replaced. The stickum residue will come off with
one or another of any nimber of solvents: nail polish remover,
mayonaise(!), etc. (Hint: try the solvent on a mnot-too-visible part of
the case, to see if it reacts. if it does, be *very* careful!)
Also, there are leather cases available for many scanners. Maybe you can
find one to fit yours.
Get a coat with softer pockets.

I've had the PRO43 for over a year and put ni-cads in it last summer. I've found the nicad life to be VERY short...I've asked in this NG if anyone else has this problem and got no replys! YES they still have problems with memory ...usually with a scanner though you can use it till the batts die then charge them up. In my case, I cant keep them charged long enough...and its NOT the batteries (eveready yellow ni-cads) as I have the same batteries in an ICOM portable and they last much longer! I still think the ni-cads are a better deal than alk's though...

Ta> I know you can reprogram a Maxtrac-100 2 channel VHF high band to a 16
Ta> channel, but how about to a 32 channel?? It has a 5 pin connector in
Ta> the rear. Any technical advice would be greatly appreciated. Thanx in

How do you do the 2 channel to a 16 channel?

... Catch the Blue Wave!

Hey guess what I jsut found. you are wrong. The Percon site clearly
has the above mentioned frequencies plus many more!
Check this out!

Spectrum Data By PerCon Corporation

1498. Re: Mathematical Image Freq Calculation

Newsgroup: rec.radio.scanner
Date: 1996-01-18 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <4dlhc5$cf1@hopper.acm.org>
Source record: 242168

> I read in a book on scanning that the freq at which an image occurs can
> be calculated by doubling the IF freq and adding it to the freq of the
> target.
> ... my scanner is triple conversion ...

In some scanners, the receiver can be tuned 2*IF above the target. In others, it's 2*IF below the target. In triple conversion scanners it can get a little more complex <g>. For two GRE-made receivers:

PRO-2005 1st Loc Osc = 612 + 2 * int[(RcvFrq-0.5)/2] (25- 520)
= 612 + 4 * int[(RcvFrq-0.5)/4] (760-1300)
PRO-43 1st Loc Osc = 611.2 + 3.2 * int[RcvFrq/3.2]

In both cases:
Image (target) Freq = 2 * (1st L.O.) - (RcvFrq)

In both rcvrs, the image is 1220 MHz above the tuned freq., and well outside the passband. While this eliminates conventional images, they are both subject to signals penetrating the plastic case and entering the first IF or second mixer. These show up as images of a TV channel audio repeating every 3.2 or 4 MHz.

I think I prefered scratching a wire across a hunk of galena <g>.

1499. Good Info for Voorhees Twp. NJ PD

Newsgroup: rec.radio.scanner
Date: 1996-01-18 00:00:00 UTC
From: Joe Cardani <IE17n1l@TJUVM.tju.edu>
Message-ID: <4dlma1$3ri@mail.TJU.EDU>
Source record: 242169

Here's some good information for Voorhees PD (County Dist. 34):

FREQUENCIES

155.745 Voorhees PD dispatch
(dispatcher is id'd as District 1)

155.565 Voorhees PD secondary "switchover" channel

UNIT IDENTIFIERS

100 Series First Platoon Patrol Cars
200 Series Second Platoon Patrol Cars
300 Series Third Platoon Patrol Cars
400 Series Fourth Platoon Patrol Cars
500 Series Fifth Platoon Patrol Cars
600 Series Detectives and Investigators
700 Series Commanding Officers *
800 Series Traffic Cars

* 700 is Chief of Police, 701 is Deputy Chief, 702 is Captain,
703 to 705 are Liutenants.

PATROL CAR IDENTIFIERS (for 100 thru 500 series-using 100 as example)

100 Shift Sergant (Shift Commander)
101 Sector 1 Greater Voorhees Area
102 Sector 2 Alluvium Area
103 Sector 3 Echelon Mall Area
104 Sector 4 Avian/Rainwood Area
105 to 109 Roving Patrol Cars
110 Bike Patrol

K9-1 K-9 Car (dog's name is Kato)

10-CODES

Voorhees uses same codes as Camden County up to 10-85. They added the
following:

10-86 Lochout
10-90 Dispatcher needs Medication
10-99 Gone for Day
10-100 Out at Headquarters

Finally ambulances sometimes ID themselves on Police radio as
6600 units.

Squad 66-8 is voorhees Ambulance
Squad 66-9 is Kresson Ambulance

Please let me know what you think about this info via E-mail
and if any interest in other communities exists.

Any clarifications or qustions please Email me.

If you check with Durham now you will find their prices to be higher.

I suppose it is a case of their supply is going down so they increase price. :-)

1501. Cellular on the BC3000XLT

Newsgroup: rec.radio.scanner
Date: 1996-01-18 00:00:00 UTC
From: lui@netcom.com
Message-ID: <luiDLE05F.A8y@netcom.com>
Source record: 242171

I just got my my Uniden BC3000XLT yesterday and it's a vast improvement over my previous unit, the PRO-2021. I used the auto store feature to search and store channels in the 1005 - 1030 MHz range. What frequencies are these images of (i.e. where in that forbidden band are the signals coming from?)?

Is there any easy way to delete all of the channels in a bank so I can use the auto-store feature to place channels there again? If the bank is already full, then I can't use them for auto-store.

I really like the unit, but the case I bought doesn't have a protective clear window for the display. Do I have the right case? The picture in the manual looks like the case, the LC-3030, has a clear plastic window which covers the display.

Stephen

lange@cadvision.com@cadvision.com (lange@cadvision.com) wrote this...

..*>Anybody know of any Pro-34 Mods?

Sure... You can restore the frequencies in the cellular range by clipping D11 (on the bottom board when looking from
the back) This requires desoldering the antenna jack and the volume control from the first board, 4 post/screws,
removing several wires. It's actually fairly easy once you look at the system when you get it open.

You can also speed up the scan rate a little by replacing the crystal (CX-1) with a slightly higher freq (I haven't
done this to mine yet but I've heard that you can use a 3.57 Mhz TV colorburst quartz here)

Which is why Morse code is used to communicate with deep space probes...

NOT!

Morse code is not the most robust mode of communication today. Morse code is an incoherent digital coding. Coherent coding methods offer a considerable improvement in robustness. There is such a thing as Coherent CW (CCW), which brings the advantage of a coherent mode to CW, but CW is not well suited to this; a conventional digital code is better.

Morse code is arguably more robust than other modes *done by hand*, but it is not the most robust mode. I don't have the URL here, but Phil Karn offers a web page demonstrating this. Use a search engine to find it; you'll be surprised.

Message-ID: <4dm1bl$m3g@mksrv1.dseg.ti.com>
Source record: 242178

Hi Bill,

I've had this posted on rec.radio.scanner and alt.radio.scanner for about a week, with very limited success finding folks who know something about the subject radios. Can you offer any additional help?

I just received my latest DAMARK mail-order catalog and noticed that they have the Uniden BC-350A/450A scanners for $79.99. Since I've been wanting a scanner for awhile, this seems like a good chance.

What I'm wondering is:

1. What are the real capabilities of this receiver? In true marketing style, the ad tells little other than 50-channel, 11-band, and 100-channel-per-second scan rate. Anyone know what the actual frequency coverage is, and how well these radios perform?

2. Is this an easily modifiable scanner for increased performance? What mods are available?

3. Is $79.99 a good price? The units are advertised as "factory recon-ditioned", with mounting bracket, AC adaptor, telescopic antenna, DC power cord, and cigarette-lighter adaptor. Since I'm ordering from out-of-state, there will be no tax and DAMARK has free shipping.

All help appreciated,

Martin Jones

Message-ID: <4dm3og$k1q@usenetw1.news.prodigy.com>
Source record: 242179

I recently came across a large quantity of brand new Bearcat 200XLT's on "closeout" for $149.00. I have a 200, and have used it extensively for the past 5 years, so I know that this is an absolute steal! I plan to buy 5 of these and "save" them for future use/sale.

Are ALL the 200XLT's modifiable for full 800Mhz coverage, and if so, are they all as easy to mod as mine was? (Open the back, flip the board, and cut the resistor above the chip?) Or is there a "cut-off" of some sort? Since production of the 200 was halted prior to 4/94, I would guess that they are all fully modifiable (?)

From: dber@tiac.com
Message-ID: <30fdb97c.2448439@news.tiac.net>
Source record: 242207

Hello all,

I've been lurking for the past week in this newsgroup and have read the three "main" documents entitled "Introduction to Scanning", "How To Find Scanner Frequencies" and "Buying a Used Scanner Radio". I own a Pro-32037 and am pleased with the performance but what I didn't see in this group yet and would like to know is....

Is there any way to connect a battery to my system for use during emergencies?

First off, it has a 13.8V female plug on the back which is used for car cigarette lighter adapter. It says to use an adapter which supplies a full 12V and delivers at least 500mA and its plug must correctly fit the DC 13.8V jack on the back of the scanner.

I figured it would be fairly easy to just buy a cheap adapter and cut the cord and wire in a 12V battery which can be found at most hardware stores, but I don't know how safe this is. Has anyone successfully hooked up a battery to their base scanner for use when the power goes out or should I just pick up a cheap hand-held for those situations?

Thanks in advance and take care,

Dave Bernazzani

Keep in mind that if you plan to use your counter outin the daylight,
those darn red led's in the startek are awfully hard to read.
my first counter had red led's and it was basicallyu impossible to
read the frequency in bright daylight. Maybe they've fixed that
problem now, but I would want ot see for myself before buying a
counter with limited useability

Oh, come now, my dear Peter Breath! YOU never were into scanning.

You are still after a pair of my skivvy shorts to eat. So, I'll tell
ya what....post me your mail address up there in the Portland, Oregon
region and I will mail you an especially crusty pair, just for you.

Howzzat?

Well I can.
By first advice you not to by the 8000 because its expenive for starters.
The control software lets you hook up your scanner to a computer via an
interface. The most common is the Pro2006/OS456 combo. For a total price
of 4-500$ itï¿½s state of the art...not portable though.The software comes
in different tast. ScanStar..Scancat..Scannerware...Probe..and so on..
Both Dos and Win (Win95). Use your infoseektool to find the companies.
One problem with the 8000 is that you canï¿½t connect it to an external
antenna without the unit going bananaz from overload at the input. Canï¿½t
handle multipath and strong signals. Ok itï¿½s small but best for closeup
scanning at simplex transmission maybe.

>show them on the 40-50Mhz spread.
>
>WRONG BAND!!!!!

Please don't quote the whole enchilida jsut to add a few lines!

Now first Percon Corp is not my DBASE!
I agree there are errors in that dbase but the errors I am aware of
are of a different nature. I own a copy of their program which I have
either loaned to someone or misplaced. I checked their WWW site and
the erros I am aware of are still there. Bummer!
But that will not affect 99.9% of the people out there.

As far as the way it is setup on the WEB you must be careful to search
for all the frequencies in use using different service abreviations as
not all frequencies will be listed under PP. Also there is a move up
in frequency all over the country. Chances are if more then one band
is listed they are or will be on the higher of the two bands with the
lower band having been abandoned for all practical purpose.
Cobb County GA sold their UHF equipemnt when they went to 800MHZ this
last year. It is now in commercial service in another area.

> Maybe you can tell me who first put it on paper?

As far as I can trace it back, the very FIRST ideas
of the sort were put on paper by a fellow named
Glenn Borland in 1988.

After him, with differing ideas, but similar in some
respects were these guys, in no special order:

Robert Shaw, Neil Base, Lyn Burke, Miles Abernathy,
Tony Neumann, Stephen Cook, Mark "somebody", and
there may be more whose names I'd have to look up.

Your name is not on the list, Farm Boy.

Sorry. :-))

The big fun part is when you listen more often, and you start to recognise
people. During the day you hear a person calling for busyness,
at the end of the day he calls his wife to say he'll be late,
and 3 minutes later he makes a date with his mistress.

And I won;t deny enjoying the odd bit of phone-sex. You'd be surprised what
women will say to their husbands over the phone...

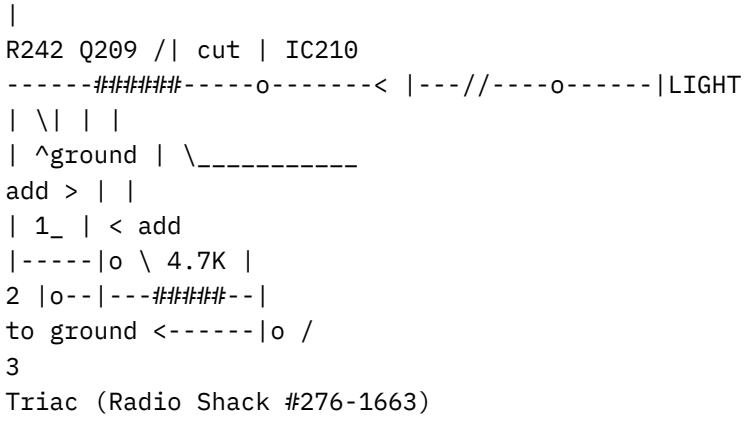
G > and go off when you turn it off instead of the 15 second timer its on?
--
I've come up with a mod where the light stays on when the LIGHT
button is pressed, but to turn it off, you'll have to temporarily
switch off the radio:

Locate Q209 (RT1N141C) which is near the main CPU (IC201 - UC1147)
and is connected to the LIGHT terminal of IC201. Connect a Triac
across Q209 as in diagram with a 4.7K resistor and cut the track
leading to Q209 with a razor. That's it.



Triac (Radio Shack #276-1663)

I did the modification quite a number of years ago, so the Radio
Shack number may have changed, but any similar Triac (which is a
silicon AC switch) will do. Connect #1 terminal to Q209 as shown
above, #3 terminal to ground, and #2 Gate to a 4.7K resistor,
which goes to the LIGHT terminal of CPU IC210. I still have the
package, which contained 5 Triacs for $2.99 Can. Again, prices
may have changed in the meantime.

Hi Chris, The codes I know are as follows:

10-1 Return to station
10-2 Call by phone
10-3 Meet with...
10-4 Okay
10-5 Location
10-6 Repeat
10-7 At Location
10-8 Available
10-9 ?
10-10 Ambulance
10-12 Bathroom
10-13 call Home
10-16 Cancel
10-99 Bomb

The other code number were changed about two-years ago. I have the original list. The current one can be obtained by a beat officer. When I have time, I will obtain one. This is the codes for the prior offensives.

Aloha

Brian

The FAF - Frequently Asked Frequencies is a collection of assignments where specific channels / frequencies have been allocated nationwide in the U.S. The intent is to answer the queries that arise periodicly and are of interest to all scanner users.

If anyone has corrections or additions to the FAF that fall within this intent, I would be happy to receive them, but there are better places for posting frequencies for specific users or localities.

1535. Newbie questions (PRO-2006 and more)

Newsgroup: rec.radio.scanner
Date: 1996-01-18 00:00:00 UTC
From: kylscott@hpicc.dseg.ti.com
Message-ID: <4dm7lg$on7@mksrv1.dseg.ti.com>
Source record: 242230
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have decided to get into the scanner world, and am trying to
decide what scanner to purchase. I have heard a lot of good things
about the RS PRO-2006. Some questions:

If cellular coverage is not an issue, should I still go with
2006 or should I look at 1996 era scanners? (i.e., are the 2006's
electronics superior in performance to today's designs?)

If I want to buy a new 2006, where would you recommend shopping?
So far, the only place I know about is Durham Radio. What kind
of price would you pay? (i.e., if a new 2006 and a new 2042 cost
the same, which would you get?)

Does anyone know of projects/products that would give CE-232+2006-like
features for any 1996 era scanners?

Is there a FAQ for either alt.radio.scanner or rec.radio.scanner?
I grabbed Bob Parnass' posts the other day and found them to be
helpful; but I am also looking for MOD sources, more product comparisons,
etc. Are there any ftp repositories that I should look at?

There seems to be a strong polarization between those who like the
RS/GRE/Uniden products and those who favor AOR. Any opinions from
folks who have used both?

Are any of today's units easily modifiable to add HAM frequencies
(for those that don't already have them)? I realize that today's
units are not easily modifiable for cellular, but wasn't sure if that
engineering change also made it hard to add ANY extra coverage.

Additional info:

I need to be able to scan trunked 800 MHz systems and operate in heavy RF
emission environments (Dallas+close to FD/PD xmtrs).

Cellular coverage would be nice, but not essential.

HAM coverage would be nice, but not essential.

I want to be able to record transmissions on certain channels only.
(ideally, I could record just one frequency while scanning several).
I realize this requires mods/add-on hardware.

I have ordered "The Ultimate Scanner" but have not yet received/read it.

I have ordered two 2006 related reprints from "Monitoring Times", but have
not yet received them.

RS has a sale on scanners until around 1/27.

Any help/comments/advice you have is greatly appreciated.

Thanks,

-Kyl

1536. Monitoring the Counter Terrorists With An AR8000

Newsgroup: rec.radio.scanner
Date: 1996-01-18 00:00:00 UTC
From: vhealey@crl.com
Message-ID: <30fdaf46.11530315@nntp.crl.com>
Source record: 242231
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Monitoring the Counter Terrorists

As we move closer to the 1996 Summer Olympics and its expected associated terrorist attacks it may be helpful to exchange some information on how to monitor the counter terrorist operations.

Locally here in Georgia the metro police departments are under going rigorous training in dealing with terrorism.. They stage various events with high school and college drama classes for the SWAT teams to respond to complete with blood and other gore. The military has simulated a counter attack using choppers and special elite squads among the high rises of Atlanta GA. Neat!

An attack against the President would be a type of terrorist attack. I decided to check out how improved his protection was with all this new training in place during his recent visit during the MLK political event.

Background a few years ago I checked out the security associated with Regan/Bush entourage. These guys fly into Dobbins AFB on Air Force One then take a car downtown for the event. Federal, state and local police provide the required security. I selected a hill in a cemetery over looking the AFB and brought a camera and a couple of radios. Several other curious types also joined me to catch a glimpse of the proceedings from about a mile from his plane when it was parked on the ground. Now the feds were the most responsive to the &#65533;danger&#65533; we could have posed. They had two people, a man and a woman in two cars with out of state tags come up and park behind us. I noticed them covertly checking out my voyager mini van as they calmly took up standing positions just behind us. What really suprised me was an armed helicopter gunship that swooped up from the base and flew directly up to us stopped for a short hover then it pulled up and shot away to hover over the path of the motorcade. A terrorist in such an obvious location would have been toast!

Now at the time everyone was on vhf and uhf and easy to monitor with a relatively cheap AR1000 hand held scanning radio. The FEDS used scrambling on vhf and were unreadable. I could follow all the activities of the President with ease though including an open clear phone patch from the plane in the 70 cm band.

NO LONGER

The training and new skills really do show up during this visit of the President. I checked out my old site in the cemetery but a business

had bought some of the ground near highway US 41 and I didn't feel comfortable standing there with so many people around. They might not understand a spectator watching the AFB in such a strange location and try to take matters into their own hand. Cobb County GA is an area with many rednecks (extreme right wing militia types) and a lot of guns! After checking which way the wind was blowing and watching the flight pattern for a few minutes it was obvious which direction Air Force One would use when it departed. I circled the AFB and parked in a business parking lot just outside the base at almost directly at the end of the runway. I had a very clear view of Air Force One and activities on the base. No one challenged me or even indicated they were aware of my presence. Several times a fixed wing aircraft would fly over relatively low and slow but they showed no undo interest in my presence. Several times county police patrols passed but no one even looked in my direction. I suspect a for real terrorist would have succeeded in this vantage point in knocking out Air Force One with a suitable weapon while it was low and relatively slow in its take off transition. This is an security lapse that they need to be more careful with IMHO. There was a motor cycle office stationed about 300 feet away but I was hidden from his view and he didn't look particularly alert to me.

But the question was when would the President be leaving Atlanta? I detected digitally encrypted speech in the FEDERAL area of the 70 cm band. This appeared to be a frequency hopping thing as it would appear on certain frequencies for only a fraction of a second. I am familiar with the various digital type of signals heard in the various bands and the sounds of data transmission from various modems. Depending on the tuning one could mistake these signals as mere noise. Using the AR8000 I played around with the various modes USB FM LSB etc. as well as bandscope to determine what kind of activity was going on in this area. A more sophisticated radio is needed to crack and track the traffic in this area when the FEDS do not want you to know. I give them and A+ for communications security against hobbyists at this time.

The local police have all switched to Trunking Radio Systems (TRS). The Georgia State Police still use a repeater on 155.910 that is very easy to monitor. They also have TRS capabilities I assume but I haven't pursued a study of their new frequencies yet since I am quite happy listening to them on VHF. And here lies a very serious shortcoming in the anti terrorist program. I give the local police a C+ in communications security and the State Police a D-. I could follow to a great degree the step by step location of the President and company by listening to the State police. A critical aspect was knowing the time. Now in one communication I overheard in the 800MHZ band a local CCPD officer refused to disclose to the actual time when an inquiry was made by an unauthorized person. Digital data terminals were used to pass this information to certain key officers in the Presidential detail. The use of these terminals is still relatively

rare here in Cobb county and this is the first time I have noticed
their use. But serious lapses in security were noted. One zone
commander told all his officers to stay clear of I-75 during a fifteen
minute time period because they were going to shut it down for the
President and he didn't want them delayed in responding to calls. A
second more serious lapse was when an officer with detailed knowledge
was talking to his girlfriend via phone patch (I love these things as
they really are unaware of how totally insecure they are!) and he told
her when he would be available for a tryst at her place and precisely
why he was being delayed and for how long. ;>)

The Atlanta Police rate a mere C- as they were somewhat worst in
keeping secure communications in mind. Overall the AR8000 showed
itself to be an outstanding scanner to monitor TRS in this situation.
I keep Atlanta TRS and Cobb TRS in separate banks. The details
assigned to provide Presidential security used a small sub group of
TRS frequencies from each bank. I discovered that I could select both
sub groups using the AR8000 SELECT SCAN FEATURE with ease. I did this
by listening to each bank for a few minutes and any time a frequency
was obviously related to Presidential security preparations. I would
press function which pauses the scan until another key is pressed. I
then tagged the frequency for select scan. One can delete individual
frequencies on the fly from the select scan list as needed. SELECT
SCAN allowed me to monitor the ten or so 800 MHz frequencies in two
totally different Trunking Radio Systems totaling (27+15=) 42 TRS
frequencies which I found to be a very interesting and powerful
feature of the AR8000 in real life use. The police found one body
(elderly male downtown Atlanta) and a bunch of suspicious characters
during the Presidential visit. Bill Clinton also was driving them
crazy by jumping out of his car "to work the crowd" which delayed his
departure for over an hour. I never did see him leave as I grew tired
of waiting After hearing the actual expected adjusted departure time
(remember the horny officer?) I went home to watch the news and take
a nap.

I don't really feel very secure knowing that a determined terrorist
with a major religious or political agenda can probably still achieve
their goal in spite of all the modern training and devices available
to our government today.

Ki4je

PS Please forward me any frequencies and methodology of monitoring
counter terrorist groups you know of that I may try them.

My pro46 has the same damn problem. I searched for mods, but came up
empty handed. I would be interested if you find a fix though. Good
luck.

I have a Radio Shack Pro-2006 Scanner for sale, It looks like it was
just pulled out of the box. It has been modified for cellular and scan
speed increased. I told several people that inquired that it was sold as
someone (Unamed) told me they were going to buy it. I will sell it for
$300 firm plus shipping. If interested reply to me at
mike.brooks@thefishnet.com
Thanks

LCD EL panels often have a protective "plastic" cover on them when
new. I've restored old panels to new by taking it off (So it was new!)
DONT TRY TAKING IT OFF IF ITS NOT THERE THOUGH!!!

1540. HELP... Computer Interference Problems

Newsgroup: rec.radio.scanner
Date: 1996-01-19 00:00:00 UTC
From: JeffC@gnn.com

Source record: 242035

I just purchased the WEFAX III fax demodulator/software, and I'm using a laptop PC to run the software. I am experiencing severe interference from my monitor. The interference is traveling through the patch cord from the demodulator primarily, with some interference also due to radio/computer proximity, when the cord is not connected.
Could someone give me some advise on eliminating this problem. I would also appreciate any advise on reducing some of the noise comming from the power cord of my PC.
Thanks,
JeffC.

I'm not a HAM and I know better than this.
CW is more robust than RTTY, maybe.
It certainly is NOT the most robust method of communication today!
Even the Coast Guard has stopped monitoring for CW distress calls.

I have just recently purchased a Realistic pro-2026 scanner. I am from Vancouver, b.c Canada and am still relatively new to scanning. The problem is that I don't know very many frequencies in my area. I don't want to have to buy a scanner book for 35 bucks either. I would really appreciate any frequencies that anyone has to give, or any info on where I can get frequencies for my area. Thank you very much

Jason Pang

1543. Cell channels, by the numbers - Was Pro-51 & Cellular

Well, if that's in the following list (and it is), it's a cell channel.

Here is a list of all Cellular Frequencies:

Non-Wireline Wireline

Channel Number	Tx Freq Mhz	Rx Freq Mhz	Channel Number	Tx Freq Mhz	Rx Freq Mhz
1	870.03	825.03	334	880.02	835.02
2	870.06	825.06	335	880.05	835.05
3	870.09	825.09	336	880.08	835.08
4	870.12	825.12	337	880.11	835.11
5	870.15	825.15	338	880.14	835.14
6	870.18	825.18	339	880.17	835.17
7	870.21	825.21	340	880.20	835.20
8	870.24	825.24	341	880.23	835.23
9	870.27	825.27	342	880.26	835.26
10	870.30	825.30	343	880.29	835.29
11	870.33	825.33	344	880.32	835.32

does anyone know where o.p.d. freqs moved too, they disapeared about
two weeks ago
thanks S

1545. Does anyone know any mods for the pro-2026? (other than the cell mod)

Newsgroup: rec.radio.scanner
Date: 1996-01-19 00:00:00 UTC
From: Nelson Pang <npang@wimsey.com>
Message-ID: <31006212.B67@wimsey.com>

I have just purchased a Realistic pro-2026 scanner. It is already modified for cell pickup, but I was wondering if there are any other mods that I can do. Thank you

Jason Pang

1546. Got a BC9000XLT without instructions Owners Pls Help!!

Newsgroup: rec.radio.scanner

Hi Bc9000XLT owners!

I just recieved a 9000 from a company that has served me *very*
well in the past.
Unfortunatly, the scanner arrived without instructions.The company
is sending them but it won't get here until next week.
My problem is that I have a rare weekend off which I had planned
to use getting aquainted with the scanner.
I had no problem programming the scan channels but just about
everything else is a mystery.
I'm especially wanting to know how to program MODE,DELAY, & ALPHA
but *any* help or tips you can provide would be appreciated more than
I can express!!
I thank you very much!!

Tom Aldrich aldrich@netins.net aka swami @:<}

1547. Re: Pro43: Short recharg. battery life?

of
>nicads in a different radio and these last much longer (several days of similar
intermittant use)
>before requiring a charge. has anyone else had the same problem? I've checked the
charger..it
>seems to be fine. The Pro43 does seem to last a bit longer on Alkaline AA's but still not
as long
>as my other radio (Icom 24AT).

Your battery life with your PRO43 is normal, provided that you are using the PRO43 in scan
mode,
versus manual mode (sitting on one frequency). Battery life depends a lot on how often the
scanner
stops, and how loud you have the volume setting at. I believe that the PRO43 at full blast
draws
something like 100 mA. So for 500 mA AA nicads, four to five hours is normal. I have a
spare
battery holder for my PRO43 which I keep stuffed with a second set of nicads for quick
changeover.

When the PRO43 is sitting on one frequency, I believe that it has a battery saver which
toggles the
receiver off and periodically powers it up to sample the frequency for activity. This
stretches the
battery life significantly.

Other radios will consume the AA nicad's charge based on the same basic principles:
activity and
basic current draw of the circuitry (did they make the circuitry efficient or not?). My
Yaesu FT530
in single-band mode can stretch a 600 mA pack to ten hours in non-battery saver mode, and
weeks
in save mode. That's because I tend to listen to a quiet frequency. However my PRO43's
usually
stopping every few seconds, and is in scan mode when I use it.

In general AA alkalines will have much more capacity than their nicad counterparts. However
alkalines
have a higher internal impedance, and will not have as high a voltage output under

comparable current
draw compared to nicads.

>been wanting a scanner for awhile, this seems like a good chance.

Ummmmm, Damark peddles "reconditioned" merchandise, especially in the
scanner department. Some people claim to have good luck with them,
but the several items I got from Damark all had to go back because of
defects.

>What I'm wondering is:

>1. What are the real capabilities of this receiver? In true marketing

> channel-per-second scan rate. Anyone know what the actual frequency
> coverage is, and how well these radios perform?

Speed is its claim to fame. Not performance in any other respect.

>2. Is this an easily modifiable scanner for increased performance? What
> mods are available?

Mods are not "available" like from a shopping list. Mods are driven
by what a user wants and needs that isn't resident in the scanner of
choice. However, the scanner has to be capable in the first place.
Uniden scanners are notoriously like the Muntz TV's of 30 years ago.
Hollow. EMpty. Where's the beef? There are exceptions, but the
BC-350 is not one.

>3. Is $79.99 a good price? The units are advertised as "factory recon-
> ditioned", with mounting bracket, AC adaptor, telescopic antenna, DC
> power cord, and cigarette-lighter adaptor. Since I'm ordering from
> out-of-state, there will be no tax and DAMARK has free shipping.

I guess it's a "good" price. I wouldn't pay it, but you just gotta
understand it's probably reconditioned or a closeout or both. I don't
recommend it, but on the other hand, you could find worse deals
somewhere if you looked around. :-)

Mike,
There is a goop available at just about any auto or boat supply
place that is designed for polishing out scratches in plastic windows
such as boat windshields and convertible back windows. I think it's
called 'Crystal Glaze' but I'm sure they'll know what you want if you
just ask for plastic window polish. I've also had pretty good results
getting rid of small scratches in plastic using toothpaste (I use Crest)
and a soft cotton cloth. Don't laugh, it really works.
Regards, Mark
